With 1.7 MHz IF you are going to have to construct your own LC band pass filters in front of the AD9874, if 1.7 MHz is the first IF.

If this is the second IF and you have proper filtering (ceramic or crystal) at the first IF, say 10.7 MHz, a very simple filter at 1.7 MHz should be sufficient. Due to not so spectacular performance of that chip, I would suggest using a selectable IF filter at 10,7 MHz (or whatever the first IF is), to even roughly match the required bandwidth of the transmission.

If the IF filter would be 110-280 kHz wide to allow broadcast FM reception, using such receiver in Europe to receive the 7.0-7.1 MHz amateur band when there are very high power international broadcasters starting at 7.1 MHz, might give quite disappointing results, since those strong broadcast signals would control the AGC reducing sensitivity and you still would get a lot of intermodulation products.

It also appears that the quoted dynamic range applies only to certain AGC settings.

The use of 1.7 MHz IF with a very wide input filter may be problematic at least in countries that are still using the AM broadcast band actively, with very strong signals up to 1.6 MHz. On the other hand, local 1.8 MHz amateur radio signals may be quite strong. In any superheterodyne receiver, there is always a risk for signal break-through from the environment to the IF stage at that frequency range. For this reason, common IF frequencies, such as 10.7 MHz and 455 kHz, are usually excluded from transmitter frequency assignments.

>I see that FM audio goes from 0 to 53 KHz and RDS is at 57 KHz.

While the modulation index for the RDS signal is quite low, thus producing only the first order Bessel sidebands at +/- 57 kHz from the carrier, the stereo difference signal S can have a quite high modulation index, thus producing the first pair of Bessel sidebands below +/-53 kHz from the carrier but also producing some significant

second order Bessel sidebands below +/-106 kHz and possibly even the
third order at +/-159 kHz.

Of course, this requires that there is a strong high pitch tone only
in one audio channel to get a huge difference signal.

```

Is there someone with experience as like that during ECHOLINK
operation?

NO BANANAS - NO APPLES - just ping games.......................

Never ending test pings ghosting through the Internet since 2006 what
we recorded and looged.

What's behind that tactics and abuse strategy?

With blocking of DHCP PORT 67 and 68 the ghosting and ping knocking
are over.

What's are the PRACTICAL reasons for that phenomenon and tracking control - TOT net in Thailand and ABUSE from US via DHCP and ICMP Echo Port 8?

Over the years I have found random tins (some square with hinges, some
round) are great to use for project boxes. Especially for very small
circuits (ie preamps) that need RF shielding.

Can anyone recommend a good vendor of small tins? Buying them at the
supermarket gets expensive, and I hate wasting mints (I already have
too many! my teeth can't take anymore!). For my current project even a
box half the size of an Altoids box would be too big (I am currently
looking for something the size of a matchbox, or round ones as big
around as a quarter and about 1/3" deep).

Any recommendations would be much appreciated!

Go visit your local gunshop. In particular, the ones that cater to the black powder folks. The primers for a muzzle loader come in exactly your description of the "round one". After they've used the primers up, they're thrown away. Might visit a compounding pharmacy as well. A lot of medication salves come that way too, the pharmacist no doubt has empties after compounding some medication or other or perhaps even has empties that he stocks to supply customers with some of his products.

There's good reason to modularize, but this is getting close to too much modularization.

I turned on the rig and was tuning around. Everything seemed to be working, and a few minutes later the audio ceased and "unlock" was sounded in cw and the display panel quit showing the frequency and showed 7 dots instead. Each time I touch the tuning knob the same thing happens. I have the Instruction Manual that says nothing about this condiition. Has anyone had to fix this sitiuation? The sole modification I have on this rig is an interface so I can have a log.

As with many small project enclosures, the market is crazy
such that you can get it as a container for a product,
cheaper than if the container IS the product.

I think you'll find buying empty tins is more expensive
unless you bought them by the pallet. Possible alternatives
in the tiny size you want include pill tins or gum tins. I
haven't seen any pill tins like this for years (but then I
hadn't been looking for them) but the candy isle at your
local stores are probably still the best bet (if not at the
checkout / cash register lanes.

A cheap pocket watch that doesn't work. Toss the guts, and you have a
nice case. Fools the eye, as the French say.

Al

I make small (and even medium-to-large) cases of arbitrary sizes out of various widths of aluminum "U-channel" for the sides and flat pieces of aluminum (or ABS textured plastic, etc.) for the "top" and "bottom". For rather small sizes, both the channel and the flat pieces are stock items at larger R/C hobby / model stores.

Sounds like the exact symptoms my TS-940 had and it turned out to be the
well known PLL unlock problem.
There are many pages of info via google search, might be same for the
TS-140, might not

Can someone tell me what a feedthrough capacitor actually does? One source says it passes DC or low frequency signal through a panel, and another says it passes any signal through said panel. Are they nothing more than a feed-through device with a small amount of capacitive reactance? My Encyclopedia of Electronics leaves me hanging on this one...

Thanks for any help,

Dave

Hello Folks,

Sorry but I am not familiar anymore with what's out there today and searches at the major manufacturers left me a bit confused. Sure, receivers like the R8500 have a computer interface but there is no info how fast it is etc.

So, is there a scanner that can be used as a simple spectrum analyzer?

Mostly to find EMI sources, no need for a tracking generator.

It should be free of relays for the band filters. I've used a JRC receiver for conducted EMI and the relays are now pretty worn. So is the encoder shaft bearing because it can't be PC controlled. Not good. It should be reasonably fast so you can thoroughly scan across a few hundred MHz in tens of seconds, not minutes. Ideally USB, no idea why many current radios still use RS232. And yes, it can be a "receiver on a card" if it has to be. The only one I found is Winradio but the web site only says "register your interest", no pricing. That makes it appear as if there may not be an actual product but I am not sure.

A good feedthrough capacitor is arranged so that the capacitor part
has very low parasitic inductance and resistance between the center
fed-through conductor and the case.  The case may be intended to be
soldered to a shield can, or may have threads so it can be mounted
using a nut (or perhaps into a tapped hole in the shield can).  They
are used to get relatively low frequency signals into and out of
shielded areas, most commonly.  You can get them in various
capacitance values.  1000pF is common, for example.  Overall circuit
design will determine what frequency range can be passed.  For
example, 1000pF driven by a 1 ohm source impedance will have a -3dB
corner frequency of about 160MHz, but driven from a source impedance
of 1000 ohms, it will be a 160kHz corner frequency.  It's pretty
common to use them in conjunction with a series inductance or ferrite
bead on one or both sides, very close to the feedthrough, so that RF
isn't picked up by the lead and fed through because the impedance is
too low--the inductance or bead guarantees a reasonably high impedance
at RF frequencies.  You can also get feedthroughs that have not only
shunt capacitance, but also series inductance or built-in ferrite.
(Note that the ferrite provides some inductance at moderate
frequencies, but at higher frequencies--up to a point--the series
impedance becomes mainly resistive.  That helps damp resonances.  See
curves of impedance versus frequency for parts found on the TDK
website, for example.)

Hope that helps...

Cheers,
Tom

Wow. Thank you Tom. Lots more than I found with Google... It is much
appreciated.

Best regards...

Dave

Greetings:

Today, while perusing the wares at a local marine outfitting store, I came upon 300 foot reels of 20ga. 7-strand copper wire intended for use as "fishing cable". The price is roughly 6.7 cents/foot and the sample I was given appeared to be no different from wire sold for electrical purposes except for the very tight twist and strong tensile strength. To me it looks like great antenna wire at a good price in view of the copper bubble. I don't have a milliohmmeter so I cannot conduct conductivity tests other than to say that a few inches of it zeros a DMM.

Has anyone used this material?

Regards,

Michael

No. But if it's for shortwave, in my early days I have used all kinds of
wire. Including some kind of clothesline with a galvanized core and it
all worked fine. The only thing that got hot and occasionally exploded
were the baluns.

If you need to lower the corner frequency Tom mentioned you can solder a
0603 chip capacitor in the range of 0.01uF to 0.1uF from feedthrough pin
to the can on either or both sides. I always have a whole can of those
at hand, like the salt in a kitchen.

COOL!  Thank you, Joerg.  I will definitly file that in my memory box.
Thank you.

I love usenet...

Dave

Revamping an old homebrew SW receiver I built about 30 years ago. Is there
an IC that will serve as an AM SSB FM detector. The existing AM/SSB detector
```

is on a board the size of a playing card.

You could probably twist some of the FM/IF detectors into doing that. Many of them have RSSI outputs that go as the log of the signal strength, I've seen literature that suggests you can block the DC from that and feed an exponential stage to get AM detection with built-in AGC. For SSB, if you switched out the quadrature filter for FM detection and injected a BFO into the appropriate pin you could get SSB.

But if you're playing around with a board the size of a playing card, why not build three optimized detectors, or get ambitious and slap down a DSP with appropriate ADC and DAC resources?

But be careful with a DSP in a receiver. They require a clock and
generate all kinds of RF noises. Might have to be in a can.

Of course, a DSP can do all sorts of other stuff like DRM. Although I
doubt DRM will ever make it into the market.

This old dog would have to learn some new tricks to implement DSP. I thought
I remembered seeing a chip somewhere that did SSb AM and FM.

Tim's right there is enough room for three descrete detectors. I can easily
squeeze it all in if I redsign the board, Maybe a PLL circuit for FM unless
someone can suggest something more modern. Probably a special purpose chip
available that I am not familar with. I wanted to adFM so I could use the rx
with VHF/UHF converter. IF is 455Khz.

Jimmie

Once you've gone to a PLL, you're mostly there. Add a bit of phase shift network (the old analog Signetics PLLs always seemed to get away with a bare minimum), and a product detector, and you've got your AM detector. Then you've got your product detector, so all you need is a crystal oscillator for a stable BFO.

If I would build it myself I'd go all out and try to make the best dang
detector this side of the Mississippi. Definitely DBM.

Some are pretty brazen. AFAIK the Winradio goes from a 1st IF of around
109MHz straight down to around 15kHz. No idea how good that works, could
not find anyone who has it.

Hello all of you,
During the last field day some members of our club ask if it is
possible to connect to the main station two headsets and a speaker at
the same time. Each headset should have his own control of volume. The
volume of the speaker will be control by the vol of the radio. We
would prefer to use only passives components (no transistors, no power
supply only transfo and/or potentiometer.)
Just point me to the URL that will be ok

Happy day,
73 de Jean (VE2GHI)

PS:. Hope you had a great field day

I found "hard drawn" copper wire used for safety and ground on suspended
chandeliers also works great. It's about the same cost but comes in may
gages.

If you want quadrature LO signals, and you are operating below half (or ideally below quarter) of the DDS maximum output frequency, then you might find that the best approach is to use the cleanest DDS chip that you can find with a single output, then filter that to remove the harmonics, DAC images etc. and then square it up with a LVDS receiver or comparator, and divide by 2 or 4 using the flipflops of the divider to generate quadrature. The challenging part would be ensuring that propagation delays don't spoil the quadrature, but it probably wouldn't be any harder than making two matched re-construction filters to use with an I-Q DDS chip. The fact that you end up with quadrature square waves rather than quadrature sine waves is a good thing (not a disadvantage at all) with most kinds of mixer.

Chris

Thanks, Tom,

I ran a single turn of wire from my antenna input through the toriod, and it does give me much better tuning ability. And WWV at least comes in like it's in my back pocket. The 1300 UTC broadcast of Voice of Korea was lost in the noise, but I'm guessing that could just be atmospheric conditions.

Thank you for the input. Any other ideas on how I could sharpen the resonant peak of the tank circuit?

Dave

Well, a VFO is not a complete piece of equipment. It's something that might be integrated into any number of different devices. Yeah, you could hook one straight to an antenna and make a QRP transmitter, but he didn't ask for a QRP transmitter, he asked for a VFO.

Saying that buying a VFO module is not in the spirit of homebrewing may be right for the old-timers who used to make their own resistors by baking carbon and build their own capacitors from mica sheet they dug up in their backyard. Yes, I've met folks like that. But they're remarkably rare.

Even getting away from the issues of lots of homebrewers being uncomfortable with laying out a SMT DDS synth, doing a very well-done temperature compensated LC tuned VFO is something that requires considerable skill. In fact I've done both and found the DDS route to be easier, if less satisfying in the end!

Even manufacturers of major reputation often buy their VFO's and canned crystal oscillators from other sources.

Tim.

I finally got around to replacing the wires from the potentiometer, rheostat, input and speaker out all with shielded cable which worked - 99.9% of the noise is gone. The only noise left is a slight buzz which goes away when my hand touches the guitar strings. (Which leads me to question whether the guitar is properly grounded. Any advice on how to ensure that it is?)

Anyway thanks to everyone for their replies, the shielded wire did the trick.

I have heard there are some tubes that use plate caps that are basically the
same as a 6L6.
The only readon I want to use something like this is because of the design
of the output transformer
I have. The B+ connection is on the bottom, underside of the chassis, and
the plate connection is on the top.

Jimmie

Basically the same as in beam tetrodes in the same power class, yes.
There are tons of them; one good way to figure it out is to get your
hands on an ARRL handbook of the appropriate vintage and go shopping
among the transmitting and horizontal sweep tubes for ones that look likely.

Awl-- (also posted to rra.antenna)

I posted some time ago regarding the tuning circuitry of car radios vs. home radios/stereos.
I had long noticed much superior tuning in car radios over my home radios.
Several apparently knowledgeable people on a few radio ngs confirmed this, even explained it, altho this went over my head.

So based on this assumption of tuning superiority, I went to *great lengths* to remove a very nice 6-speaker stereo from a car I'm junking (1990 Mazda 929S--nice car, too, seen better days), to hook up in my shop, so I can listen to some decent radio, instead of brain-killing Reality TV.

Finally accomplished said task, and, big big bummer, the reception of the car radio in my shop/garage is even worse than my home radios/stereos!
Yet, this *same radio*, when I used to park the car this very same garage, had great reception.

Whazzup????

And, in general, what can I do about this reception problem, since it appears that a car stereo is not the immediate solution?
I have a 100 foot tree outside, and I'm thinking of climbing it and putting some kind of antenna at the top.
If I did this, what would be the best thing to put up there, for as much reception as I can get: fm, am, TV, whatever else is oscillating up there.

What is the problem here, and in much of the NYC area?. No valleys, and I am even on a bit of a hill, about 10 mi. from Manhattan.
What are my options? Preferably simple/cheap options, but at this point, I'll try pretty much anything.

When I was a kid (in NYC), I calculated wavelengths, etc, and had antennas "cut to size" for the various FM stations I was listening to, in all kinds of orientations. Musta had about 30 antennas taped up in my room. It was hilarious, BUT I got good reception, and LOTS of stations!
Those same dipole-type antennas are near-useless here.
:(

TIA.

Unless the night rate were substantially less than the day rate, inherent
losses in any energy conversion proly make this strategy a wash.
At 80% of the day rate, he was proly breaking even.

I would like to hook up a variable capacitor to some audio circuits I built for learning about synths and amps
(schematics are here:
http://www.geocities.com/usenet_daughter/tone_generators.htm)
http://www.runoffgroove.com/littlegem.html
http://www.runoffgroove.com/ruby.html
http://makezine.com/09/crackerboxamp/
)

because in some of these the capacitors change the pitch, tone or other qualities.

These circuits run off a 9V battery and use capacitors with ratings such as
220 uF
100uF,
0.1 uF,
0.01 uF
0.047 uF
so I would want variable caps in this range.
Do these exist? Online all I am seeing is ones rated in pF.

Also, assuming I find these, and get them working in the circuit, and find a desired setting for a capacitor, how do you measure the capacitance? I have a multimeter but have really only used it to measure ohms.

Thanks...

They'd be HUGE. Easily as big as a fridge or a car, even a truck in the case of 220 �F.

What matters is the timing, as it's timing that matters in amps and synthesizers, except for power supplies or sample and hold circuits where capacity is more important.

To get long timing with small capacitors, use large value resistors, and make sure you have low leakage capacitors.

Your on the right track OK - dont give up. Car radios ARE better,
their designed to operate on crappy aerials in a noisy environment.
BUT, they are optimised for the car type aerial - wont go into the
physics. As an starting point,can you plug in a car antenna, even if
it needs getting an extension lead to get it outside and into clear
space? - the leads are available from car stereo places, come with all
the correct plugs/sockets, and (usually) some extra capacitance to
match into the car antenna.....

Let us know how you get on, its a worthwhile project....

It is funny how a car antenna is vertical, when most dipoles are horizontal.
Anyway, I have a car antenna floating around I could use.
In the meantime, I dropped two conductor wire from my top window, about 40
feet up.
THAT oughtta get some kind of signal. Unfortunately, it's mostly vertical,
would like to get some of it horizontal--assuming that would help.

Discussions off-line are pointing me to a good log-periodic antenna, on top
of a big-assed tree, rotatable.

If *that* don't work, I guess I'm just gonna have to start whistling old
tunes. :(

Yes, because the 807 is literally the 6L6 in a different 'package'.

(The 5B254/M was made in Britain as a so-called "miniature 807", but it
must be extremely rare in the USA.)

You cannot buy variable capacitors with these values, but you could make up
or purchase an arrangement of switches and fixed capacitors quite cheaply
which a) would be the next best thing and b) would directly address your
"how do you measure the capacitance" question. Commercially they are called
Capacitance Substitution Boxes or Capacitance DecadeBoxes . They're not
infinitely variable, of course, but are finitely practical!

Nice. I'm not sure that's what the OP wanted, (more likely a single
continuous control of something), but if this switched-cap box were built
to 1 nF resolution, for $40 extra or so, you can add a variable capacitor
shown on the page David linked to: http://www.stormwise.com/page3.htm

That way you can have any infinitely variable value, just not in one sweep.

Well, I intentionally didn't suggest adding a variable as a) it would re-open the Pandora's Box of how to calibrate the thing, and, b) the combined tolerances of the fixed components would make a nonsense of such calibration anyway.

As the OP sounds as though he may want several capacitors to be simultaneously variable his best homebrew move may be to build up a number of simple, two or three decade BCD-style, successive approximation systems. Each will need 4 switches and capacitor combos (15 caps of one value) per decade - a nice little homebrew project.

Initially, I didn't assume the OP wanted a large variable capacitor at all, but was mistakenly trying to match fixed sizes with variable sizes without considering why such things are not common practise. Calibration aside, the variable I suggested adding IS a viable idea, assuming your switched-cap box is valid. After all, if you CAN get any value, then you set it as you need. If it's tuning frequency, you measure the frequency.

But as I said WAy early in the thread, first reply, if you really want a sweep of possible timing values, just use a fixed cap and a variable pot, as standard. The OP was talking about synthesizers, after all, he mentioned them explicitly.

Another thing: That variable cap on the page David (and I) linked to, is
more than 1 nF. So long as the fixed caps had a tolerance tight enough, it
should cover (1.398 nF allows for greater than 20% tolerance on nominal 1
nF increments). Not that any of this matters, in practise.

Very simple: there isn't much market for high-quality home radio
receivers for a few decades now. With products not being sold by
quality but by how many features they have (look at a DVD player
remote control: more than 100 buttons!!!!) this is not surprising.

Car radios antenna systems are matched to the radios. Take a car
antenna, put it on a big piece of sheet metal (aka "virtual car"), and
cable it up to the radio with a correct length of cable (cable
capacitance comes into the matching at least for AM) and you'll do
fine. With some matching circuitry you could match up to the dipoles
```

etc. you want to build.

If your garage/shop has a metal roof it will be a fine "virtual car" ground.

Tim.

Subject: Re: motherboard LED connectors and posts?

I think you might be looking for something that was called "daisy
chain
jumper wire" way back in my wire-wrap days. It came as a spool of
flexible, stranded insulated wire about 24 guage or so, with an
insulated single pin socket every 5 inches or so. You just counted
off
the number of jumpers you wanted to interconnect, and snip them off of
the roll. The sockets fit over standard .025" square posts quite
nicely
and allowed testing minor modifications without wrapping on new wires.

They had a multitude of uses. I still have some leds and other things
with single 5" wires attached to each leg (each with it's own socket
at
the end).

I haven't even looked for this stuff for years, and know I hava a half
roll tucked away in a box somewhere. If I could only find it I'd at
least have a part number and manufacturer to provide. I'll see if I
can
dig it out sometime in the next couple of days...

Good Luck

>spacing and pin size.

This would be a way to make certain components (such as pots &
trimmers, 1/4" phono jacks, switches, or other sub-circuits) "plug and
play" for various prototypes + experiments. The motherboard size
headers are small enough where the leads match the components I'm
using and the pins on a motherboard that LEDs plug into are just the
right size to plug into a solderless breadboard, but are more durable
than the regular breadboard jumper wires.

>You might check the following surplus sites (and ebay).

And...while building that "virtual car" for the antenna ground-plane,
don't forget to make a car body sized box with upholstery type sound
absorption and place your chair in the center of this virtual speaker
box. You may be surprised at how good that simple car radio will
sound with you inside the speaker box.

I am looking for a way to make certain components (such as pots & trimmers, 1/4" phono jacks, switches, or other sub-circuits) "plug and play" for various prototypes + experiments. Similar to the breadboard concept but more permanent. Headers like those found on computer motherboards for connecting power LEDs are small enough where the leads match the components I'm using and the pins on the motherboard are just the right size to plug into a solderless breadboard, but are more durable than breadboard jumper wires.

Rick suggested "daisy chain jumper wire" (see below for a description) and I did some searching on various sites, but no luck. Can anyone say what else this might be listed under or where it might be found?

Thanks...

That should be a big help - I just needed some keywords: header,
socket, board mount, IDC.

This would be a way to make certain components (such as pots &
trimmers, 1/4" phono jacks, switches, or other sub-circuits) "plug and
play" for various prototypes + experiments. The motherboard size
headers are small enough where the leads match the components I'm
using and the pins on a motherboard that LEDs plug into are just the
right size to plug into a solderless breadboard, but are more durable
than the regular breadboard jumper wires.

>You might check the following surplus sites (and ebay).

Thanks again

> I tried searching for LED connectors and get LEDs. I want the
> connectors and posts, not replacement LEDs for a motherboard.

Ah, yes, the connectors are general-purpose, and have nothing to do
with
LEDs specifically, although this is the context in which you happen to
have encountered them; therefore searching on the term "LED" is
leading
you astray.

There are literally hundreds to choose from, but here are a couple
example part numbers I pulled out of the Mouser catalog to point you
in
the right direction:

Header: Mouser 517-2312-6111tg, 3m 2312-6111tg
Socket: Mouser 517-974-01-02, 3m 929974-01-02 (board mount)

the sockets also come for crimp pin or IDC connections. I think once you stop searching for "LED" you'll be able to find things easily.

Subject: Re: motherboard LED connectors and posts?

Male pin headers and female socket connectors with 0.1" pin spacing. Also socket contacts (inserts) are often sold separate from the socket itself.

They can be very expensive from electronics supply houses, ridiculously so for the female connector and insert.

http://www.digikey.com/scripts/DkSearch/dksus.dll?PName?Name=609-2342...
http://www.digikey.com/scripts/DkSearch/dksus.dll?PName?Name=609-2301...

What exactly are you looking for? Straight plastic sockets with 0.1" pin spacing but do they have to be the very thin (black in your links) type such that on a row of pins in a pin header, you could plug in two right next to each other, OR could the plastic connector body be larger like those used on fans? The point is that if looking for an especially low price, one option is surplus electronics 'sites which may have something that would work (or may not) depending on the requirements beyond the basic # of pins, spacing and pin size.

You might find them called something else, generically grouped as just "connectors" or slightly more like "pin connectors" at a store/site that doesn't deal with as many connectors and just doesn't follow standard naming practices.

You might check the following surplus sites (and ebay).

>
> Thanks...

As others have mentioned, these values are not widely available in variables partly because they are unweildy, and partly because they are rarely needed.

Take a look at your circuits. Many of the capacitors are "uninteresting". For example, if you look at your "little gem" amplifier, the 100u is simply filtering the supply (looks like a little overkill), the .01 appears to be mostly DC blocking, although it is small enough it might have an efffect on bass response. Ditto for the 220. The only one that looks like it might be interesting to experiment with is the 0.047. The other circuits are similar. Capacitors have all sorts of functions in various circuits, and for many of those functions, playing with the values isn't very satisfying.

Before you go building these things and playing with them, I would suggest modeling them in some SPICE flavor or another. This would allow you to experiment with the frequency response without actually building the circuit. Once you have seen some interesting SPICE responses, *then* go buy some capacitors.

As far as measuring capacitance, you can buy meters, more commonly LC meters, and many multimeters include them. You can also make an LC oscillator, measure its frequency, then put the unknown C in parallel with the C in the oscillator, and measure the frequency again. You can then calculate the unknown C. Another way is to put the unknown C in series with a known resistor, put some RF across it, and measure the voltage drops with an RF probe. Again, a little math reveals the unknown C.

My preference was always a strip of 0.1" pitch turned pin socket pins with ribbon cable soldered into the socket side. A little hot glue or electrical grade silicone RTV sealent at the breadboard or PCB end and judicious use of heatshrink at the component end provides strain releaf if required.

Plug streight in to breadboards *WITHOUT* ruining the contacts, but sufficently durable that the mods I did to my Sinclar QL nearly 20 years ago using this connection methor are still totally reliable in operation.

It would be even funnier to see a horizontally-polarized antenna on a car<grin>! (actually, I have one - for the 144MHz ham radio band)

Nearly all AM/MW stations use vertical transmitting antennas, not that matching polarization is particularly important in that band.

In the U.S., the vast majority of FM stations use both horizontal *and* vertical polarization (I think they call that "mixed polarization" overseas) so a vertically-polarized car antenna works just fine.

> THAT oughtta get some kind of signal. Unfortunately, it's mostly vertical,
> would like to get some of it horizontal--assuming that would help.

I don't think it'll make much difference.

A 1625 is an 807 with a 12 volt filament, if that's the filament voltage that you have.

I believe they actually use circular polarization, so there's a 3dB loss when received by a linearly polarized antenna. Still, I'm told this is almost always a huge improvement over what you get with the transmitter and receiver both using linearly polaraized antennas.

> I don't think it'll make much difference.

I agree. In fact, as far as I've seen, unless you're running high gain point-to-point links, it doesn't seem that matching antenna polarizations on both ends matters all that much, since the fields will tends to have become randomly polarized as they propagate and reflect anyway. (Of course, I figure one of the much more experienced people here can correct me on this if need be!)

Thanks for the consideration but 6 volts will work fine. I am building my daughter a guitar amp and I wanted it to look "vintage".

Don't know if the OP was from the UK, but UK night rates are of the
order of half the day rate (though you have to pay a higher day rate to
qualify!), but only for 7 hours.  I do wonder if it would be possible
now to set up a battery/inverter/load sharing system sufficiently
cheaply to lower the cost of daytime use significantly.  Probably
illegal though.

================================

Why would it be illegal storing energy ? I can't imagine that it is
illegal charging the batteries of a Golf buggy , at night tariff.
I am sure any golf club would do that to reduce their electricity bill.

BTW ,living in the UK myself ,night tariff indeed normally starts at
about 2300 hrs and finishes at 0600 hrs the following morning .
At our place switching happens with an electro-mechanical timer with a
spring mechanism such that following an outage the timer keeps running.
Eventually that spring has to be re-wound by the electricity supplier
,but that hasn't happened the past 15 years........so the timer at our
place now comes into operation around 2320 hrs ,but then of course also
day tariff starts about half an hour later at 0620 the following morning.

No problem with a different circuit, but more so if you want to
connect to the supply. In fact people with wind etc. generators can
get permission to sell "green" electricity back to the grid
(automatic metering). It would be somehow satisfying buying night
time electricity from the suppliers and sell it back to them at a
profit.

 I can't imagine that it

Just to get back on topic (nearly), my meter is controlled from a
radio signal (?198kHz) which can move the 7 hours about within a
longer window.

Why would "they" wish to assassinate your character?

Well, let's put it this way - just because this is the first time it's happened in this way,
from these people, on this scale, doesn't mean that it hasn't happened before, on a lesser
scale. At university there were people who quite overtly hated me and would have wished
something nasty to happen to me. Because of where I went making the wrong sort of enemies
is pretty deadly.

"They" would wish to assassinate my character because it had all been done before, and
because they knew I would not be able to react in any other way than I'd reacted previously.

>>> ##: They invaded my home with their bugs, they repeated what I
>>> ##: was saying in the privacy of my home, and they laughed that it
>>> ##: was "so funny", that I was impotent and could not even communicate
>>> ##: what was going on. Who did this? Our friends on BBC television,
>>> ##: our friends in ITN, last but not least our friends in Capital
>>> ##: Radio in London and on Radio 1.

Please give details of when, where and by whom these
comments were made, so that they can be checked.

This was four, five years ago... sorry, I don't remember. I can remember individual incidents,
words which were repeated by different people at different times in different

locations.

Around the end of 1992 Private Eye rtan a front-cover with John and Norma Major, with
the title "Major's support lowest ever" and John saying to Norma "Come back norma" on the
front cover. What can you read in to that? Not a lot, seems like standard fare for PE.
The first time I saw it I was in the pub with some people from work. One was expressing doubts
to the other (let's call the first one Simon, shall we? and the second one Phil?) about
whether what was going on was right. Phil's answer was that if Private Eye was doing it
then it must be ok, "they're usually right".

A few days later, again near work, there were some students laughing in the street,
"Were you COMING BACK later? But I thought you said you were COMING BACK ha ha ha?"
Play on words, you see. Not very nice, either. I had start medication soon afterwards.
Clever people, these chaps who think up PE titles. Just slightly lacking in any
sense of morality.

>>> ##: How did they do this? I'll give you an example. About a year ago,
>>> ##: I was listening to Chris Tarrant (Capital Radio DJ among other
>>> ##: pursuits) on his radio morning show, when he said, talking about

>>> ##: trying to kill him. We should be done for attempted manslaughter"
>>> ##: which mirrored something I had said a day or two before.
>>> ##: Now that got broadcast to the whole of London - if any recordings
>>> ##: are kept of the shows then it'll be there.

What was the date of the broadcast ?
Out of 2 million plus listeners, why should you be
the only one that Tarrant was allegedly referring to ?

Sometyime in spring 1994. I can't remember the date, I heard the broadcast in the
car - I was going into the office from London that day and just happened to snap
on the radio, and hey presto! Mr Tarrant gives us the benefit of his excellent
understanding.

>>> ##: That's exactly what we did. We went to a competent, professional
>>> ##: detective agency in London, paid them over 400 quid to debug our house.
>>> ##: They found nothing.

What was the name of the detective agency and their
address ?

I don't see why I should tell you that, but they're in Yellow Pages; they're
a well-established outfit.

```
>>> PM: >What? Spend a quarter mil. a year to amuse themselves? And why not

                Is your name truly Mike Corley, or are you using it as
                an alias ?

It's an alias. I'm not English by ethnic origin. If someone manages to pronounce
my name as well as that guy did then they must have been really trying.

>>> ##: There's a little story behind this. First of all, in 1992 I worked
>>> ##: for a company where the people made clear they knew what was going on,
>>> ##: first of all directly (the very first evening I was there I went out to
>>> ##: the pub with them and the Technical Director said to another guy,
>>> ##: "is this the bloke who's been on TV?" "yeah, I think so")

                Have you appeared, or been reported by name on TV ?
                When, where and by whom ?

No. Never. Not directly.

>>> ##: Also, in summer 1992 I went on a trip abroad to Europe by coach,

                What was the name of the coach company and your date
                of departure ?

It was a national express coach. At dover we boarded a ferry for Holland
somewhere.
The company that organized the trip went out of business some time ago, so they
won't
have records of passengers - so we can't get any corroboration from anyone else
that way. We tried all that last summer, ran into a brick wall.

The other thing is in summer 1992 I was visibly ill, so other people in the
party might remember that more than anyone getting at me on the coach trip.

>>> ##: >>Yes, this gets me. I think the answer is that I was set up by
>>> ##: >>someone. I was very aware when this started back in 1990 that I
>>> ##: >>was being painted as a "threat" to which people had to "react"
```

Why were you being painted as a "threat"; is this related
to a "deep,dark, secret" ?

Aaaarrrrgh. I think I should make clear that that's their created justification
rather than the real reason. They started harassing first and then came up with the
reasons for it.

>>>
>>> ##: I think I know who set me up.

Who ?

Someone who knew me some time ago. Someone who would have been able to talk this
little campaign into existence.

>>> ##: The bloke can't even control his own mind without medicine.

Is this true ? What is the medication and dosage ?

Yes, I'm afraid so. Sulpiride, 200mg a day. It's designed to stop people
coming up with the sort of ideas you've heard here for the last few weeks.
Give him a higher dose!!

In the long term it causes tardive dyskinesia, tardive dementia and general
nasty stuff to your brain. So it's three years of sulpiride talking to you here.

Only on VERY LARGE wind farms. Most small sites rectify the wild AC
and use syncronous inverters to feed back into the grid.

As I remember, it was from one of those "if you have to ask the price,
you probably can't afford it" breadboard manufacturers. Augat, or Cambion,
or the like.

Dig, Dig, Dig. Ah, no. It was Berg (part of DuPont). In an old (1994)
Newark catalog I keep for reference, it's "Daisy Chain Jumpers", $215.72
for a chain of 250, either 2.5 or 5 inch spacing.

We used the same crimp terminals at a place I worked at in the '80s.
The hand crimp tool cost about $900. The contact is self contained and
doesn't need any plastic shell to make the contact spring action work.
So the terminals can fit into a shell (like we used them), or work by
themselves, insulated with shrink tubing.

But things aren't that bad, now. They use(/used?) very similar crimp
terminals in the header connectors for PCs, like the plug to hook the
reset button or speaker to the mother board.

Jameco sells this stuff as ".100" Non-Polarized Connector Housings and Crimp
Pins". IMHO, try part 100766. Page 155 in the May 2007 catalog. 12 cents
a terminal and the crimper is only $10.95. Add a little bit of wire and
shrink tube. What a difference 25 years makes...

>
>   How is that arranged? I presume the windmills produce DC?
>
>   Or if AC how do they arrange synchronisation with the
> mains?
================================
Domestic wind energy systems in the 1-10 kW range often involve an AC
generator ,its output being rectified with the DC fed into an inverter
which is synchronised with the grid.

In the UK a company 'Windsave' sells and (obligatory) installs 1 kW wind
generators which are connected to the domestic 230V-50 Hz system .
The location of the windgen and its nearby inverter  cannot be too far
away from the switchboard (up to 15 metres). Apparently the output
voltage  of the inverter is slightly higher than the grid supply , such
there is a preferential pick-off from the wind gen system.
However when no power is consumed wind generated energy is fed  into the
grid.
I have 'heard' that in some countries (but not in the UK)
electro-mechanical kiloWattHour meters can rotate  reversed  when fed
with power from the consumer's side, with the counter counting down .
This would be very beneficial for people with the above described system
```

. Perhaps someone on this NG can confirm that these meters really exist
and in which countries.

For my AR operations + desk lighting and peripherals I use 12 V
batteries charged by an up to 170 Watts windgen and 2 solar panels with
a total capacity of 128 Watts(peak)...........just for the h*ll of it.
The wind gen. has a 3 phase generator and integral rectifying diodes(in
fact 2 bridge rectifiers of which 1 is fully utilised and the other one
only half)

Frank GM0CSZ / KN6WH   The future is 'renewable'

> If this amp powered by a battery?

A 9V battery, although I plugged a 200 mA 9V AC adapter into it and it
worked also, though I didn't leave it plugged in that long - maybe if
it was in longer it would have fried it. I'm not sure how many mA
would be unsafe for this circuit - I looked up 9V batteries to see
what the current typically is, but it seems this depends on the
circuit. Until I find this out I'll probably just use a 9V "battery
eliminator" AC adapter.

> In this configuration, pin 2 is the most sensitive node, and

I think I'll start with this. Thanks for your detailed input! !

> eliminator" AC adapter.

The reason I asked is that a battery eliminator will
probably have some hum in its output, and pin 7 is there to
remove most of that interference from getting into the
amplifier.

See the data sheet for the LM386:
http://web.mit.edu/6.115/www/datasheets/LM386.pdf

The supply voltage enters the input to bias the output at
half of the supply voltage, going past pin 7, which is
usually bypassed to ground by 10 uF or more to smooth the
bias current from the supply. Even with a battery supply,
the voltage will bounce around a little from the current
drawn by the output transistors, and bypassing pin 7 helps
reduce that effect, too.

>> In this configuration, pin 2 is the most sensitive node, and

>
> I think I'll start with this. Thanks for your detailed input! !

Good luck.

Dont'forget Mendelson's www.meci.com

These outlets will often have very good prices, but sometimes it can be hard to tell exactly what you are getting, and you cannot count on getting the same thing from them next week.

I would suggest you call Digikey and Mouser and have them send you their paper catalog. there are hundreds of very similar connectors, often with very different prices. It is really hard using the web search for these things to locate the best one for your purposes, although Digikey does have a scheme where you can download parts of their catalog as pdf. Mouser probaby does too. Mouser and Digikey seem to have a competition on who can kill the most trees, though ... both of their catalogs are over 3000 pages. You will not make friends with the mailman this way.

You will find that Mouser and Digikey tend to have different pricing, as does Newark. The one that is cheaper for one thing often isn't cheaper for another. I don't think Newark has a paper catalog, unfortunate because they are often cheaper than Mouser and Digikey.

Also be aware that on these types of connectors you sometimes need to buy the pins seperately from the housing.

(snip)

The current with the adapter is also controlled by the attached circuit. The 200 mA rating is the maximum current the load can draw, before the adapter risks over heating. The only real risk with the adapter is that, under no load conditions, its voltage will rise above its 9 volt, full load rating, enough to damage the chip. All versions of LM386 can handle a 12 volt supply and are not usually damaged by 15 volts if little sound is being produced. I would check the adapter with no load and make sure it does not produce more than 15 volts.

I think you might be looking for something that was called "daisy chain jumper wire" way back in my wire-wrap days. It came as a spool of flexible, stranded insulated wire about 24 guage or so, with an insulated single pin socket every 5 inches or so. You just counted off the number of jumpers you wanted to interconnect, and snip them off of the roll. The sockets fit over standard .025" square posts quite nicely and allowed testing minor modifications without wrapping on new wires.

They had a multitude of uses. I still have some leds and other things with single 5" wires attached to each leg (each with it's own socket at the end).

I haven't even looked for this stuff for years, and know I hava a half roll tucked away in a box somewhere. If I could only find it I'd at least have a part number and manufacturer to provide. I'll see if I can dig it out sometime in the next couple of days...

Good Luck

The DK1HE "Superdipper" "Dipit"?. Yeah, it's a fantastic idea!. It's
like manually rotating a little forth and back the tuning knob, 400
times a second. A little drawback is its (understandable) complexity.
And it goes up to only 42MHz. The english version is in
www.qrpproject.de/UK/DipItUk.html
If I can't find an already chewed design, I may end up building this
thing, plus some ideas from the DUBUS VHF UHF Technik book by DL7QY,
reaching >1GHz but with the aforementioned amplitude clipping at low
end.
If this is NOT what you have, then I will gladly accept your offer!
Thank you for answering!.

=====================================
However car batteries can be used very effectively for amateur radio operations by using them as a peak current provider in conjunction with a modest (current wise) PSU.
A nominal 100 W RF SSB transmitter might need say 20 Amperes in the peaks , but (even with audio processing) ,on transmit ,the average current will hardly exceed 8 Amperes and taking into account a 50/50 tx/rx duration ratio , such a transmitter will happily operate for long periods with a say 60Ah car battery and a 6 Amperes power supply unit.
And the battery will have a long life. Of course ,to be close to the transceiver the battery will have to be of the sealed variety .

Frank   GM0CSZ / KN6WH

I live a mile away from an AM radio station. Usually it doesn't get into
the amps, but there are/were some amps that we could hear the AM radio
station coming thru. A quick way to eliminate that is to wind a coil
with the guitar cord very close to the plug that goes into the amp. Make
the coil small diameter, 2 or 3 inches. That will choke the signal from
entering the amp. It see's the guitar cord as a long wire antenna. How
many turns? Start with 5 or 6, if that doesn't work try a couple more turns.
Hope this may be of some help.
Jack
Fender Santa Maria
Gibson SG

If you are hearing radio broadcasts, it is because of two things: 1) The bandwidth of the amp is too high, and 2) there is nonlinearity (ie rectification) in the amp, typically the input stage.

You can probably solve this problem simply with a small RF bypass capacitor across the amp input, just after the input resistor. Set the RC product to a microsecond or so.

If you look inside consumer audio amps, you'll find that shielding is not normally used.

Best regards,

Bob Masta

You failed to mention what you have on the input, which can be a factor--if you disconnect any input cables, short your input to ground right at the amp and the unwanted stuff is still there, is is very possible your unwanted signals are coming through the 5K gain pot and its leads. Signals on these leads directly modulate the output. Try this:

Replace the 5K pot with a resistor (say, 1K--the lower the R the higher the gain) soldered right on the board. Disconnect the pot wires completely. If that cures your problem consider eliminating that gain control and just using the volume pot. Otherwise, you could try shielding those wires, with the shield tied to signal ground, though I'm not completely sure that would work. Use stereo shielded cable with both wires in the same shield if possible. Twisting the two wires together may help.

You can also try Mr. Masta's RF bypassing, only on the gain pot inputs as well.

GL
Glenn

That's a pretty cool trick - so this would mean the radio interference
is coming in through the guitar and/or guitar cable?

Thanks for your reply - that's worth a try.
I was going to try wiring in a foot switch to turn the gain on & off
anyway.

By the way do you know a good online place to order shielded wire
(either stereo or mono)?
I had an old cheap shielded guitar cable I was going to cannibalize
for this, but
I would prefer to find wire that isn't too thick & easy to work with.

I am just plugging an electric guitar directly into the input. I don't
have the actual circuit here with me right now but the schematic is
here (see page 5):

http://makezine.com/09/crackerboxamp/

I believe the + of the input goes to a 0.01 uF capacitor, the - goes
to ground.

BTW can anyone explain how to add an XLR out (either balanced or
unbalanced) to directly connect the amp to a mixer or recorder?

Thanks

><SNIP>

First of all, any sensitive amplifier needs to be build in a metal box no bigger than is necessary. The box acts as a screen so you have no need to use screen leads inside the box. The circuit you

have used has no RF decoupling at the input nor on the supply (the
100uf capacitor on the supply will not decouple very well at RF), I
would put a 10n ceramic capacitor across it and, for good measure, a
100n across that!

At the input I would put something like 1n to ground (if your input
is a guitar then the pickup will be low impedance so there won't be
any effect on it's output. I would also be tempted to put an RF
choke in series with the input.

If, as I suspect, you are picking up AM broadcasts coiling the input
cable a few times at the input won't have much effect.

These links may be useful:

http://www.rane.com/note151.html

http://www.benchmarkmedia.com/caig/html/caig06.html

Good luck!

Charlie.

I need to vary the frequency of operation of a transceiver IC from 7MHz to 9MHz. The oscillator needs to feed into the crystal oscillator input and crystal oscillator output pins of the IC (the current design does not have a variable oscillator and is just using a crystal). Ideally I would like to control the frequency of the oscillator using the PWM of a micro controller (unfortunately the current micro does not have a DAC). Any ideas on the best way to do this?

This is an NG for radio amateurs who are interested in building their
own equipment including equipment from kits   NOT for buying ready
built equipment.
Conclusion : Wrong NG for you.
  Advice to you : Do a Google

I'll differ with you, OM.

He may want to build something that, except for the DDS VFO, is entirely
within his capabilities. If he's homebrewing something less complex, and
```

finds the VFO to exceed his skillset (as it might exceed mine), his query is entirely on-topic.

pawludebono@gmail.com,

Don't let the grouches turn you off to homebrewing. They're everywhere. Sometimes -- particularly when my back's bothering me -- I'm one of 'em, but I try not to be.

>

I am currently doing a project which uses 8-bit PWM to set the freq. of

a L.O. across a 250Hz range; I use a 3-bit DAC to select one of eight
250Hz segments first. The 1st L.O. is a PLL with a 2Khz step size
and 16-bit resolution. The DAC and PWM outputs and a DC offset for
centering are summed and then drive a dual varactor to pull the
xtal of the 2nd L.O. (at 56,305,000Hz center). This gives me 1Hz
resolution.

Your 2MHz range would require a 21-bit PWM for 1Hz VFO resolution
(after scaling); a 16-bit PWM would give you about 30Hz resolution.

To me, a workable solution would involve a combination of PLL and PWM
as I have done (from what I have read I would avoid DDS for reasons
of noise).

Regards,

Michael

I'd avoid using any "canned" Toko style inductors with adjustable cores. The most stable coil designs don't use adjustable cores, which are an invitation to thermal instabilities. Especially ferrites or the types with cups.

Has anyone ever heard of anything like the experiment I am currently concocting? I have taken an Amidon T50-2 toroid form and wrapped it with 57 turns of #32 enamaled wire, giving it an inductance of 16 uH, then wrapped over that layer with 150 turns of #36 wire. The first layer (16 uH) I am using for tuning my home-built active antenna, and am relying on resonance to send a signal through the outer layer, which I *think* should act like a step-up transformer for that signal. This layer is grounded on one end, and feeds into the first stage of amplification on the other. And it does seem to work, only the toroid seems to resonate at around 10 MHz with my tuning capacitor set to 114 pF, when it should (I thought) resonate at something lower, like around 3.7 MHz.

And like I said, the step-up transformer part does seem to work, but I can't tune as low as I would like. Has anyone ever hear of anyone else trying anything like this? If so, what is it called, and where can I find info on the subject?

Many thanks for any help...

Dave

What are you trying to match? I suspect your secondary winding has a lot of interwinding capacity that might be affecting it's operation. For a ""step up", it might be easier, and more efficient, just to design a pi or L matching network to do the transformation... Or, use tapped windings on the coil used in the tuned circuit. Low impedance at a lower tap point, impedance and voltage will increase on higher taps..

Hello Pete,

I'm not actually trying to "match" anything, I am attempting to step up the
voltage of the incoming signal from my antenna (a 110' longwire use for SWL)
before passing it to my first stage of amplification. I think I see what
you mean however, this sounds like an impedance matching setup. And I
hadn't thought about the interwinding capacitance. Obviously, I am still
fairly new at this.

I saw a schematic in Joe Carr's Secrets of RF Circuit Design that used a
step-up transformer before the first stage of amplification, and that gave
me the idea for using my tuning inductors (toroids) with a second winding
that might act as a step-up transformer. And it does seem to work, just not
withing the frequency range I was expecting. My goal is to pick up Voice of
Korea here in Texas, at some level of intelligability. And I am a lot

closer to that than I was with the plain-jane tuning setup. Today I picked up their 1500 UTC broadcast, which is something I have never been able to do before. (Talking about how happy Korean children are...) It is still far from perfect however...

Thanks for your input. More food for thought... With time, maybe I'll get what I am looking for.

Dave

For a broadband step up, you'd be better off using a ferrite core untuned transformer or balun.

Are you using this between the coax and a coax leadin? Or, between the antenna and RF antenna jack on the receiver?

Pete

Are there any experience with attacks on ECHOLINK Ports 5198 - 5200 by P2P connection ?

Here something of similiar
cases..

I am doing this inside of the active antenna case, using the coils used for tuning the tank circuit. It's really kind of an unusual setup, I gather. I am trying to use the resonance of the coil, which is in parrallel with my tuning capacitor, to set up a sympathetic signal in the second layer on that same coil, and feed this sympathetic signal to my first stage of amplification. That's the step-up transformer part. The whole thing just resonates at a higher frequency than I anticipated. Thus my original question: has anyone heard of this before, and what is it called/where can I find more info on the subject. Fortunately it still allows me to pull in my target shortwave station, but it's at the bottom of the tuning range rather than the top.

Thanks for your help,

Dave

That's comparing apples and bananas. These attacks exploit a
certain security hole in a certain piece of software (in this
case the dc++ client, whatever that is).

While the Echolink software *may* have some kind of security
problems of its own aswell, it's very unlikely that crackers try
to exploit them. There are (compared to P2P stuff) just not
enough users to make it worthwhile.

In any case, the attacks on this dc++ client, even if they are
operating on the very same port as Echolink, are absolutely no
danger or security risk for the Echolink software.

Here is a website that discusses a toroid RF phase shift which works fairly well.

http://www.seboldt.net/k0jd/phase_notes.html

==

Oh yes, in answer to your other post regarding DDS, look at

http://home.comcast.net/~aa0zz/index.html

This website has a DDS VFO which also provides the 90 degree split.   It uses the AD9854 and it is reasonably clean, but it does have low level DDS spurs.   It is not exactly low cost, but you do get a reasonably complete design, including the rotary shaft tuning dial interface for controlling the DDS.

W3JDR wrote:

> Sounds like the rumblings of a grumpy, stodgy old fart!

Could be but the rumblings happen to be my opinion and the man asked for opinions.

No matter how wonderful a blog could be, the problem still remains of getting people to read them. Everyone knows how to find interest groups on usenet and yahoo but how the hell does anyone find his blog a week after he announces it? It vanishes into the blogosphere. There are millions of them (perhaps billions) out there but only a minuscule fraction of that number with any following at all and even fewer with lots of readers.

His key words would be "home brewing".... Google it and see how long it takes to find him unless you happen to know his name but that's cheating. Actually, you will find hundreds of sites that sell our beer making equipment before you get to any ham radio sites.

I did it and cheated. Turns out he has lots of web pages so it makes the blog even more pointless. How is it any better than a web page? The one or two comments certainly do not justify the extra work... does it?

If someone wants to experiment with a high (power)level mixer, I do
not understand, why that person would have to suffer all the problems
of generating a stable specific frequency.

In fact getting a good frequency source cheaply might in fact be a
good thing to encourage people to do some home brewing.

"Dave" <db5151@hotmail.com> wrote in message
news:1361p54t5hfsf39@corp.supernews.com...

> I am doing this inside of the active antenna case, using the coils used for tuning the tank circuit. It's really kind of an unusual setup, I gather. I am trying to use the resonance of the coil, which is in parrallel with my tuning capacitor, to set up a sympathetic signal in the second layer on that same coil, and feed this sympathetic signal to my first stage of amplification. That's the step-up transformer part. The whole thing just resonates at a higher frequency than I anticipated. Thus my original question: has anyone heard of this before, and what is it called/where can I find more info on the subject. Fortunately it still allows me to pull in my target shortwave station, but it's at the bottom of the tuning range rather than the top.
>
> Thanks for your help,
>
> Dave

Hi Dave

Then in effect, you are trying to match a lower impedance to a higher one since you are trying to increase the voltage gain.

Without knowing the active antenna you're attempting to use, it is kind of hard to determine what advice to offer. I think you mentioned a 100 foot long wire... That would have a much lower impedance over the HF range than a 3 foot whip. If you just want voltage gain, use several turns on the bottom of the coil for coupling the antenna to the tuned circuit. The tuned circuit will provide the voltage gain. You will reach a point where the active antenna will be prone to overload, even with the tuned preselector input.

Pete

I always thought the concept of an "active antenna" was that you had a short whip and barely loaded it down. The whip itself is connected to a very high impedance point, and then the active components are there to transform that into a lower impedance for the receiver.

You basically see the idea in old car radios, where the whip was connected across the tuned circuit at the input. If you didn't use the right cable to connect it to the antenna, and if you didn't use the trimmer to adjust things to compensate for that cable, you'd lose a lot of signal.

Then solid state devices came along, and that made it much easier to do the transformation, since they took up less space and didn't need filament voltage.

A preamp or even preselector is not the same thing as an "active antenna".

The reactance of the coil at 3.7MHz is about 375 ohms. Your long antenna will likely put an impedance across that tank that's on the same order, or maybe lower, impedance. That will pretty much kill any resonant peak you got from the coil and capacitor.

You should start, perhaps, by realizing that what you are looking for is generally not the largest voltage from the antenna, assuming you can add whatever amplification you want, but rather the best signal to noise ratio or the lowest distortion. In fact, atmospheric noise is so large at these HF frequencies that it doesn't take much of an antenna to pick up more of that atmospheric noise than the receiver will contribute, assuming a decent receiver. Making the signal larger just increases the distortion and the chances that strong signals will cause distortion that covers up the weak ones.

There IS an advantage to having sharply resonant circuits in front of any gain stages in the receiver, because you can use them to get rid of unwanted signals, and preferentially select the signals you want to listen to. But to do that, you need to think more carefully about the design of the resonant circuit.

You may in fact find that it works a lot better if you couple your antenna to the tuned circuit (your toroid core and capacitor) rather loosely, like with very few turns--perhaps a single turn-- through the core for the antenna connection. Even back in the very early days of radio, the advantages of a sharp resonance achieved by loose coupling to a resonant circuit were understood: they used something called a "loose coupler" that let them adjust the coupling from the antenna to the tuned tank/detector. For best selectivity, couple lightly, just enough to get a usable signal. That means coupling the receiver input lightly to the tuned circuit, too.

Cheers,
Tom

Personally, I'd experiment with the AD9951 DDS chip, it's spurious outputs are very low....

http://www.radioamatore.it/i0cg/add9951.html

However, if somebody wants a DDS for direct conversion experiments, the AD9854 DDS has built in quadrature outputs which make it tempting. This website discusses a complete design and, the kit can be gotten from Kanga.

It is pricy, but in my opinion, it has everything I would need.....

http://home.comcast.net/~aa0zz/index.html

The only drawback is that it's spurious outputs are higher.

There are dozens of kits ... the combination FCC1/FCC2 from Norcal is one, AA0ZZ's has been mentioned as another. Kanga has a board called the PIC-EL II that will accept AmQRP's DDS-60 daughtercard and in conjunction with software available from AA0ZZ's website will do the same, plus, it has the PIC programmer on board, so you can play with various versions of the software. All 3 end up costing about the same. FAR Circuits has a board for the old WB2V model which works reasonably well and ends up considerably cheaper.

If you are concerned about soldering the AD985x chip, there are dozens of folks who do that for a small fee. In fact, if you graze the QRP lists you will discover that there are probably hundreds of folks who love to build kits so much that they are floating in them, and a looking satisfy their addiction by building kits for other people so their XYLs won't scream at the increasing pile of unused electronic gear.

The PIC-EL path is probably the most conducive to experimentation, but the most poorly packaged if your intent is to include it in one of your projects. AA0ZZ's has I-Q outputs if you are interested in exploring SDR. The FAR Circuits board of course includes none of the parts, the Norcal kit is lacking the expensive parts (switches, connectors, etc.)

Already built choices do seem fairly lean.

Hey Pete,

The active antenna is a home-built MFJ-1020A, which has a short whip and an input for an external antenna. The amplifier has the gate of a JFET (2N5486) as the input for the first stage of amplification. I can post a schematic to ABSE if you like.

After reading your last post, I think I am beginning to understand what you mean, about matching impedances. This subject has always been a tough one for me, but it interests me, and now I have a reason to study and learn it. I had no idea that was what I was trying to do.

So, it sounds like I am trying to match a low impedance signal source (the longwire antenna) to a high impedance input (the amplifier.) Is that roughly correct? If so, any idea on where I can find more info on impedance matching?

Thanking you very much for your help...

Dave

Man, I think you are right on the money with this. I get the signal, but very little ability to "tune" it in, as if the resonant "peak" is very low (my understanding.)

> You should start, perhaps, by realizing that what you are looking for is generally not the largest voltage from the antenna, assuming you can add whatever amplification you want, but rather the best signal to noise ratio or the lowest distortion. In fact, atmospheric noise is so large at these HF frequencies that it doesn't take much of an antenna to pick up more of that atmospheric noise than the receiver will contribute, assuming a decent receiver. Making the signal larger just increases the distortion and the chances that strong signals will cause distortion that covers up the weak ones.

I am getting more signal than noise, compared to operation without the active antenna, but it's not exactly "prime".

> There IS an advantage to having sharply resonant circuits in front of any gain stages in the receiver, because you can use them to get rid of unwanted signals, and preferentially select the signals you want to listen to. But to do that, you need to think more carefully about the design of the resonant circuit.

Yes, yes, that is what I am attempting to do. I am just such a newbie to RF...

> You may in fact find that it works a lot better if you couple your antenna to the tuned circuit (your toroid core and capacitor) rather loosely, like with very few turns--perhaps a single turn-- through the core for the antenna connection. Even back in the very early days of radio, the advantages of a sharp resonance achieved by loose coupling to a resonant circuit were understood: they used something called a "loose coupler" that let them adjust the coupling from the antenna to the tuned tank/detector. For best selectivity, couple lightly, just enough to get a usable signal. That means coupling the receiver input lightly to the tuned circuit, too.

My best results come from using an alligator clip with a foot or so of solid wire soldered to it, and clipping to the center conductor of the output from the active antenna while wrapping the wire around the whip antenna of my Sony 7600GR portable SW radio. This gives me a slightly clearer signal, even if it is not as loud as pluging the output into the external antenna connection of the radio. One thing I suspect is that I am using the wrong type of coax (RG-59). I believe my coax is 75 ohm, and what I probably need is 50 ohm. Does that sound right? Or am I wrong here?

Thank you so much for your help. I have been working on this for a while, and think I am getting close to achieving my goal.

Hi again Tom,

BTW, how would I calculate the impedance of the coil mentioned above for matching purposes? Would the ARRL Handbook have info on this? I googled "impedance matching:" and found some good (and interesting) links, but feel I need more.

Thanks again,

Dave

Listen at: http://www.soldersmoke.com

SolderSmoke #61

June 3, 2007
Farhan's new blog.
More AGC.
Ramakrishnan's RFI.
SolderSmoke returns to 2X QSO mode:
Echolink interview with Jim, N5SPE.
Origins of Amateur Logic TV.
"The Knack" hits Mississippi.
Kick-plates as radio cabinets.
Visit to Dayton.
Encounter with the Haywards.
Building a W7ZOI power meter.
Milton Keynes BITX80 club build.
The dangers of molten solder.
Getting oscillators to oscillate.

Tired of listening to Credence or NPR on your I-Pod?   Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack? Tune in to SolderSmoke!

RSS FEED: You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.
http://www.soldersmoke.com/soldersmoke.rss

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.soldersmoke.com

All the programs are available here.

I hope you enjoy the program. Please send us feedback.

>.....how the hell does anyone find his blog a week, after he announces it?

If you're interested in what he has to say, then you could bookmark in your browser's 'Favorites', it or put it on your browser's 'Links' bar, or set up a browser Tab for it. I follow several blogs this way. Of course, if you're not interested in following it, or if he doesn't keep it fresh enough to

sustain interest in it, then either it will die or you'll remove the browser
references to it. That's sort of how blogs work.

Joe

And just what does this SPAM have to do with homebrewing?

This is the problem with the UNMODERATED NG's on the internet - you keep
getting all this CRAP!!!!

"brisa" <brisasuave30@hotmail.com> wrote in message
news:1180064295.952456.198780@h2g2000hsg.googlegroups.com...
THESE TIRED TO WORK HARD AND TO HAVE SINGLE MONEY TO PAY ACCOUNTS OR
SOMETIMES NOR FOR THAT? THE MONEY IS FOR ALL AND A HARD WORK DESERVES
AN EXCELLENT ONE IT PAYS! I OFFER YOU TO BE PART OF THIS AID IN

COMMON, BECAUSE THE UNION MAKES THE FORCE, PROVES THE FORCE OF SOLIDARITY BY INTERNET, AYUDATE AND AID TO THE OTHERS PLEASE BEFORE ELIMINATING THIS WARNING, WOULD BE THANKFUL THAT LEA FIRST AND IT MAKES THE DECISION LATER. THIS IS NOT A SWINDLE, IS NOT ILLEGAL, IS NOT NECESSARY TO ABSOLUTELY SELL NOTHING, IS FOR SLUGGISH IS FOR PEOPLE WHO NEED AID AND WANT TO HELP THE OTHERS. MAKES SAFE MONEY LEGALLY, FAST AND VIA INTERNET! MAKES SAFE MONEY LEGALLY, FAST AND VIA INTERNET! (Suggestion: It prints this one article so that it reads it with thoroughness and thus it can include/understand it better and follow his form step by step of application.) HELLO TO ALL. - You need a car, to pay to the initial of your house or department, to pay education of your children, you need very deserved vacations, to lamentably begin a saving or any thing for your family but your pay only reaches to pay the accounts sometimes and nor after that. If you identify yourself with previous, the welcome thing to the club, if in addition you are conscientious that stops to win money is necessary to work always honestly, then east business is for you. It says thus: ORIGINAL MESSAGE While it sailed by these pages of the news, also like you it is doing it now, appeared to me an article similar to this that it said: You can gain thousands of dollars in few weeks with an investment of U.S. $6 dollars (six dollars). Immediately I thought: " OH, no! , another swindle more? ", but like majority of us, the curiosity could more, and I continued reading, and it continued saying: "You will send U.S. $ 1,00 (a dollar) to each one of the 6 names and directions mentioned in this article, later You will write down your name and direction at the end of the list having replaced to I number # 6, and it will at least send or put east article in 200 NEWS GROUPS (there are million of these anywhere in the world). " Note: If one is in another country, must exchange his national a dollars, because in all the countries they change dollars and is easier for all. For that reason we will make this business only with dollars and not complicaremos us. Any trick, the difference from this system to others does not exist, is that you have a list of 6 instead of 5, this means that your average of gain he will be After thinking it time and time again and to consult it with friends, I decided to prove it, I thought that the only thing that it could lose era the value of 6 stamps and U.S. $6 dollars and that it would take it like an investment, truth! I thought that to invest 6 dollars plus the costs of shipment by mail they were a compared triviality with which I give in my work by a pay which I am thankful but that it is not sufficient nor just. As probably many of us were a little worried about the legality about all this. Then it consults to the Central Mail and they confirmed to me that in fact he was totally legal. I remained astonished and I invested to my U.S. $6 dollars immediately... IMAGINENSE THAT! ... the few days later, I began to receive MONEY by mail! Was happy, like boy with new toy, and very surprised! And it thought that this would finish more in few days and tries to forget to me the subject, in any case already had recovered the investment, but the money continued arriving. In my first week I made between U.S. $20 dollars and $30 dollars. For the end of the second week it had made a total of U.S. $1,000 (thousand dollars)! PODIA NOT TO BELIEVE it! ; in the third week U.S. $10,000 (ten thousand dollars) and still continued arriving more! ; in my fourth week had a total of U.S. $41,000 dollars and this continues arriving more quickly (in my house, they go it opening you exceed and I obtaining "NEWSGROUP". THIS WAS PUT SERIOUS. All this was worth the trouble, the investment of U.S. $6 dollars and 6 stamps, gave its fruits, and to think that I spent more of U.S. $6 dollars weekly in drawings and lottery, and did not pass anything. The truth is that this can pass as long as works conscientiously and placing this warning in the greater possible amount of newsgroup, this works simple, while more people see it, more money I win, but even so I assure to you that you will win much more that putting 6 dollars in the best bank of on credit fixed world of 1 year. You will be receiving money worldwide, of places that nor know and in few days! Possibly he will want to rent a PO. BOX. By the amount of you exceed that it will be receiving. ASEGURESE OF WHICH ALL CORRECT DIRECTIONS ESTEN. Now So that of all this (IT IS WHAT IS GOING IT TO LIKE): Of 200 publications of this one letter in different newsgroup, we say that single receipt 5 replaced (IT IS NECESSARY TO BE PESSIMISTIC). Then I made US$5 Dollars with my name in the position #6, of this letter. Now each one of the people who sent the dollar, also makes a number of 200 publications of this one letter in different newsgroup and single 5 people to each one of the 5 original ones respond, this makes U.S. $25 more than I receive (up to here already I recovered my investment more and), now these 25 people put a minimum of 200 publications of this one letter in different newsgroup with my name in #4 place, and single 5 replaced of each one are received. It would be making other U.S. $125 additional, now these 125 people put a minimum of 200 publications of this letter in different newsgroup with my name in #3 place and single one receives 5 answers each, I I receive an additional one of U.S. $625, OK, Here this the part but amused, each one of these 625 people place puts their letters with other 200 publications of this one letter in different newsgroup with my name in #2 and each one receives only 5 answers. This causes that I receive U.S. $3.125. However these 3,125 people sent their letter and in addition they published this one letter in 200 different newsgroup, with my name in #1 place, and only 5 people respond of the 200 newsgroup, this does that I receive U.S. $15,625 dollars. Of an investment of U.S. $6. - dollars, do not think that he is FABULOUS and as I before said, that single 5 people respond of 200 newsgroup, (the real average is of 20 to 30 people) . IF THEY WANT THEY REMOVE CALCULATIONS! IF SINGLE 15 PEOPLE RESPOND .... THIS WOULD BE EQUAL A: In the position #6 =US $ 15,00. - In the position #5=US $ 225,00. - In the position #4=US $ 3,375, 00. - In the position #3 =US $ 50,625, 00 - In position #2=US $ 759,375, 00. - ((((Now the good thing comes, not scare. - In the position #1 .... (((((U.S. $ 11.390.625, 00))))) ... if, ELEVEN MILLION DOLLARS or EUROS! This is the power of the multiplication of the capital to which all we have right! As I said, this can happen but it is necessary to work intelligently and each one of us must fulfill putting this warning not in 200 but in 400 newsgroup, to send post office to everybody, to make marketing, etc. and all gratuitous means of the powerful Internet virtual, in the end your work will give fruits because you worked with effort, honesty and transparency. Once its name no longer is in the list, removes the last announcement from the newsgroup and sends other U.S. $6 dollars to the names in that list, putting its name in the place # 6 and soon will return to repeat all the process, and to begin to put them in the newsgroup again, which must remember is that million people like You and like I anywhere in the world, they are connected to Internet daily and therefore some will read these articles, so I believe that nobody will have problems to invest to U.S. $6 dollars, and to see if this really works. Some people get to think...."and if nobody responds" ..... to me as it is the possibility that this happens? , if there are thousands and thousands of honest people (who, as we) they look for a way to have financial independence and to pay accounts! , and they are arranged to treat, because "THERE IS no WORSE FIGHT THAN, THE ONE THAT NOT FOR! ", esteem that are 20,000 to 50,000 new users of INTERNET Every day, (in all world). ** REMEMBERS, HAGALO IN HONEST, CLEAN FORM AND CORRECTLY, THUS IT WILL WORK WITH COMPLETE CERTAINTY. By the way: if you it defrauds to the people, putting messages with his name and it does not send any money to the others in those lists, you you will not receive ANYTHING almost! SO THAT ALL THIS HAPPENS? BECAUSE IT IS NOT HARVESTED WHAT NOT SOWING. REMEMBER, HAGALO IN HONEST, CLEAN FORM AND CORRECTLY, of way so that it wins money and does not squander the time, if it does, will receive money of all the people who enter this business will obtain positive results, at heart these money are turning around the world, and the people that will thank for it, are the pluses needed anywhere in the world (I do not say of extreme poverty), but people, who by those things of the life are in jams and this them aid to come out ahead. "A THING IS SAFE TO THAT YOU SEND TO HIM ON WITH 1 DOLLAR, BY COMMITMENT VERY SURELY IT WILL PUBLISH TO YOU IN HIS NEXT LISTS IN THE NEWGROUPS AND BY CONSEQUENCE YOU WILL RECEIVE MORE MONEY "... MUST FOLLOW THE RULES OF THE BUSINESS, OR BUT IT WILL SEE ITSELF VERY AFFECTED BY PEOPLE INESCRUPULOSAS, LUCK FOR ALL! You aseg�rese to print this article NOW, to remove all the information as she needs it. The process is very easy and consists of 3 (three) simple steps

STEP N� 1: Obtain 6 sheets of paper and you write in each one of them "PLEASE INCLUDES MY NAME IN HIS LIST OF CORRESPONDENCE Or e MAIL" or "PLEASE ADD MY NAME TO YOUR LIST". Soon, its name also writes, direction and (OPTIONAL: electronic mail or email). And if it wants as a pretty detail also places in which POSITION appeared each name of the people of its List when You sent your DOLLAR (Ej.: "He was in the 3 position" or" You were in slot 3 ") like making it more complete. That one is, to make money and to pass it well at the same time, everything with good will. Now it doubles this one page where the previous thing has written, around a bill of 1 dollar American, it does not send to checks nor another type of payments, single American Dollars. P�ngalo everything within 1 on and m�ndelo to each one of the 6 listed people, the idea to double the paper around the dollar is for assuring that it is going to arrive at his destiny and THAT IS IMPORTANT. Of another way the people who work in the mail could detect that she is money and to remain with the THOUSANDS of YOU EXCEED that they are to him arriving; so that she recommends herself to surround everything, additionally, in a dark paper or of coal so that she does not see herself through on. What this doing is to create a service and like so, does COMPLETELY LEGAL. From now on this not sending a EURO or DOLLAR to him to some person without any reason, this paying to a EURO or DOLLAR by a legitimate service (I assure to Him, again, that this is completely legal). Immediately afterwards, it sends the 6 you exceed to following directions:

1. Guillermo Jimenez Ramos Urb. Villas de Feliza 154 Calle Lucy
Boscana
Mayaguez, Puerto Rico 00680-7301
2. Mirta Weise. Calle: Eustaquio Fr�as 4361(Ingeniero Pablo Nogu�s)
C�digo Postal:1613 Buenos Aires Argentina
3. Jaime Cruz Ravelo Calle 69 Sur No. 102C-24 Bq 6 Apto 307 Ciudadela
La Libertad II Etapa Bogota D.C. (Colombia)
4. Edgar Fernando Gerardo Moreno. Calle Tarento 116 Entre Roma y
N�poles Cluster 12 Col. Hacienda Santa F� C.P. 45655, Tlajomulco de
Zu�iga, Jalisco (Mexico)
5. Ursula Maria Mora Devoto. Calle Manuel Quiroz 180 Dpto. 208
Santiago
de Surco, Lima (Per�)
6. Olga Vargas Egusquiza. Calle Leon Velarde 115 Urb. Los Libertadores
San Martin de Porres, Lima (Peru)

VERIFY OF WHICH ALL THE DIRECTIONS ARE CORRECT. STEP N� 2: Now it eliminates I number #1 of list of above and moves the other names a number upwards (#6 becomes #5, and # 5 it turns #4, etc...) and it adds his NAME AND ITS DIRECTION like #6 of the list. STEP N� 3: Change everything what creates advisable of this one article, but deal with to maintain it the closest possible thing to the original one. Now it puts his article in at least 200 NEWSGROUP (exists more than 24.000.000 newsgroup), single need 200, but the more it puts, the more money him it will arrive. STEP N� 4: THIS STEP IS OPTIONAL: You also can send this article to other well-known people or strangers, relatives or friends through electronic mails or e-mails; for which such You will have to make steps previous and in addition to add its email to the correspondence direction and simply to send this article by email or sticking it like message of text or like attached file. Important: Remember to select, to copy and to stick solely the article or letter of format HTML of the message! NOTE: "OF COURSE, NEWSGROUP CAN SEE THOUSANDS IT or UNTIL MILLION OF PEOPLE WHEREAS an ELECTRONIC MAIL SEES IT THAT or WHO THEY RECEIVE IT ". Here some indications of how introducing itself go to newsgroup: THIS IS IMPORTANT THE MAS PART OF THE BUSINESS OF PLACING THE WARNING WITH TU NAME NOT IN 200, BUT I PROPOSE TO YOU TO PUT IT IN 400 NEWGROUPS OF AS AT LEAST HALF IN EXTRAJEROS. HOW TO HANDLE the "NEWGROUPS in simple steps. N� 1. - You do not need to write up all this letter to do hers own. He only puts his cursor in the beginning of this letter, clicks and he leaves it pressed and b�jelo until the end of the letter and larguelo. All the letter will have to be "shaded". Then, note and clicks in "Edit" or "edition" it arrives of his screen, selects here "to copy" or (Ctrl +C). This will cause that all the letter is in the temporary memory of its computer. N� 2. - Notepad" or "Word" Opens to a new file "and takes the cursor it arrives of the page in target, Presses "edit" and of the menu it selects "paste" or "to beat" or (Ctrl+V). Now it will have this letter in his computer and will be able to add its name in the place #6 of the list following the instructions of above. N� 3. - This letter in its new file of notepad like "txt Records Case out " or "text file", and whenever it wants to change something, it will be able to do without problems. BEFORE PUBLISHING THIS ARTICLE IN ANY NEWSGROUP, IT REMEMBERS THAT ALL THE WEBSITES HAVE DIFFERENT INSTRUCTIONS TO PUBLISH ARTICLE IN ITS NEWS either GROUPS or NEWSGROUP the BEST thing IS THAN THEY FOLLOW INSTRUCTIONS OF HOW MAKING IT NEXT VERAN SOME SUGGESTIONS; THESE CAN VARY ACCORDING TO THE VERSIONS OF PROGRAMS, WEBSITES, ETC. FOR WHICH USES INTERNET EXPLORER. IF NO IT KNOWS MUCH OF FORUMS, IT CAN USE THE GOOGLE TO LOOK FOR NEWSGROUP AND BEGINS TO LOOK FOR WHERE TO PLACE ITS WARNING. N� 4. - Go to newsgroup and you select "post an article" or "to write new message/discussion " in some newsgroup first is selected specific group and later loads the article in publishing new message. N� 5. - The complete content of txt Marks. case out and you copy using same previous technique. Return to newsgroup "TO NEWS" and "IT STICKS IT" there you this creating and filling with paste this letter within its program or "posting" Presses the button "post" FOR WHICH THEY HANDLE NETSCAPE. Within the Netscape program, it goes to the titled window "Window" and select " NetscapeNews ". Then it chooses of the menu "Options", select "to Show all Newsgroup" Immediately will appear a list of all the newsgroup of their server, click in any newsgroup. Of this newsgroup it clicks underneath "TO NEWS", which would have to be it arrives, in the left end of the newsgroup page This him it took to the box of messages. N� 6. - Fill east space. This it will be the title that will see all when cross by the list of a group in individual for example puts WINS SAFE, FAST AND LEGAL MONEY SINGLE 6 DOLLARS OF INVESTMENT. Mark complete content of txt cases out and copies using the same technique previous. Return to newsgroup "TO NEWS" and you this creating and filling with paste or sticking this one letter within its program or "posting" N� 7. - Press "send", that this in the left superior part and you have finalized with its first newsgroup. .... CONGRATULATIONS! Everything what must do is to put in different Newsgroup (groups) and to publish this one letter or article; when it already has practice, single will take about 30 seconds him by each newsgroup. One it forms to find NEWSGROUP, it is through the finders and Servants of the News. REMEMBER: WHILE MAS NEWSGROUP OBTAINS, MAS MONEY ANSWERS WILL RECEIVE! BUT IT MUST ENTER AT LEAST... 200 NEWSGROUP. AND ALREADY THIS! Single a note more, if it knows to translate this message to other languages (it can make it with the Tool Language of Word or by Internet), can in addition, to insert them in forums of different countries like, the USA, England, France, Germany, Russia, Brazil, (this I say it like advice to expand the possibilities that he sees much but people it), imagines that their mail sees it in China.

I have a DSW-II-20 QRP rig that needs a replacement RF power transistor type 2SC1971 in a TO-220 package.

I have looked at places I order from like Mouser, Digikey, Newark, but they do not have it. I need only a quantity of one but will buy 2.

Does anyone know of a source?

Paul

John , Yes it is c**p ,but you don't have to read it .
It also applies to 'legit' NG messages for in which you might not have
any interest.    The 'next message' button is your friend.

Another problem with the UNMODERATED NG's on the
internet is that too many clowns continue to
REPOST THE ENTIRE F***ING, UNTRIMMED SPAM PAYLOAD
in their useless followups.

Thanks for the replies. I was also able to contact K1SWL, who designed
and sold the DSW-II units. He said the 2SC1971 is now obsolete.and he
is currently supplying the MRF261 in its place.

That was before I added it. Strangely, it works about as well without it.

> How about a photo of the latest metal attempt? - remember, if it looks
> nice and neat, it doesn't really matter if it don't work too good....

I just posted one to http://schmidling.com/807b.jpg

Unfortunately, it now looks better than it works.

> Hah! - silly man - NOW you have to get the VFO stable, as well as all
> the other problems.

I faded out of ham radio because it was boring me to death once I "moved up" to a rice box. My born-again career keeps me interested because hardly anything works very well.

I finally gave up on keying the oscillator because of chirp but now it drifts so badly, I still can't use it.

It's an interesting problem though that sort of defies my analytical skills.

When I turn on the osc, it drifts up several hundred cycles in a few seconds and stops. I can find no voltage changing like that, I moved all the hot stuff out just to test that and I am stumped. It seems like it is in the tube itself.

I am now keying the grid bias of the osc and there is no chirp but it does that several second climb that would be frowned upon.

Long term stability is another problem but in the noise at this point.

Do you or anyone happen to have a couple of 1000 pf zero TC caps? I am using cheapo ceramics and they are not so good. Blowing on them through a straw has a rather profound effect on the freq.

Interestingly, if I hook it up to a Variac, I don't get 200 hz change until I get below 75VAC. This is rather amazing to me and points to a temp rather than voltage problem.

BTW, this started out as an exciter for the 8000 rig but I have since gotten the bug to make a CW rig out of it. Again, the rice box is too perfect in that mode also for my interest.

js

Hi!. I am trying to devise a varactor (varicap) tuned dip meter, that
can also work as wavemeter by turning the oscillator off.
The target is to reach up to 1GHz by exchanging coils (each with its
own complete oscillator), but needing as few as possible of them.
The main problem with the prototype is at the low end of each band:
even with back-to-back diodes, the RF amplitude goes lower giving a
false broad dip illusion. This also causes the freq scale divisions
for the dipper do not match those for the passive wavemeter.
Trying to reduce amplitude with some automatic level control often
gives rise to low f oscillations.
Any idea on low and stable amplitude oscillators?. I've already looked
up in the group and the web.

Polystirene (styroflex) capacitors are a good choice. They have a
desirable slightly negative temperature coefficient, and excellent Q.
1000pF is within the spectrum of usual values.
Or you may choose a bunch of NP0 ceramics in parallel, plus ~1/20th of
the total value made up of a N750 (-750ppm/centigrade) capacitor. Many
paralleled caps are better than a single multilayer unit because heat
(yes, real life caps do heat somewhat in oscillators) is better
dissipated away, thus reducing one of the drift causes.

==================================
I support the above opinion ,having made a simple FET based vfo for
3.5-38 MHz which serves as a training tool for the UK Intermediate
Licence practical assessment ,for which trainees have to calibrate a vfo
against a receiver and/or frequency counter.

The VFO was made (semi-ugly style) on PCB board with 'ground' holes
drilled for upright grounded components ,with the other lead to support
the relevant non-grounded components resulting in the shortest possible
interconnections.
Using polystyrene caps and with the VFO not having any buffer stage the
device fed by a 9v PP battery drifts not more than 20 Herz in 30 minutes.

What kind of battery is a 9v PP battery? And, it would likely be helpful to know what the Inductor is that the negative temperature coefficient of the poly cap is compensating for. Is that drift specification for the first 30 minutes after turn on or after the oscillator has been on for a couple of days?

Any chance of a schematic and/or pics?

Sounds interesting.

> What kind of battery is a 9v PP battery? And, it would likely be helpful to know what the Inductor is that the negative temperature coefficient of the poly cap is compensating for. Is that drift specification for the first 30 minutes after turn on or after the oscillator has been on for a couple of days?

A 9v PP battery is a standard battery pack , alkaline /NiCad / NiMH as used in all sorts of consumer electronics incl battery operated smoke alarm devices.   Dimensions :45x25x17 mm. Available all over the world.
The battery is 'velcro-ed' to empty space on the board
I did not use dedicated neg temp coeff components ,but used 4 recycled polystyrene caps from the junk box.

FET is 2N3819   but any other HF FET would do.
The tuning cap is a air variable cap (old style trimmer ,silver plated plates and ceramic body) with added reduction gear/scale in front panel.
Adjustable inductor with core is from Toko .It is mounted on its side, soldered to PCB material plane.
There is a compact foil trimmer for fine adjustment

Since double sided PCB board was used , I drilled many holes in the material and soldered through hole pieces of wire ,such that the 2 copper planes are connected at many places.

The 20 Hz stability is reached after applying power to the circuit for approx 20 minutes in a room with a stable temp.

The power supply connection to the circuit is via an insulated pin which sits on a tiny board island (having used a special PCB foil cutter which removes a tiny ring of copper material) .
Although I also could have used an upright 10 MegaOhms (1/4 W) resistor serving as pin and 'insulator'.

The unit is built onto an 2mm thick piece of aluminium bent as an L

Summarising : A typical little project using predominently junk box components,   with success resulting from using RF friendly components and shortest possible connections between frequency determining elements.

I don't have a web site to post to ,but can take a pic and send it to those interested, by email

You can contact me by e-mail by removing abcxyz from my NG address

And I assume that the PP means Peak to Peak. I'll acknowledge that a battery
has a peak Voltage, in this case, something close to 9 Volts. I doubt it
could be rated as Peak to Peak which would imply at least a couple of the

things wired back to back and providing around 18 Volts. (Peak to Peak
speaking of course, not Push Pull, cancelling even harmonics, or even
Push-Push, cancelling odd ones.)

The polys have a generally acknowledged negative temperature coefficient and
as such must be correcting for something. The inductor is an air wound
solenoid, wound on a toroid or perhaps a (for the frequency range spec'd)
quite long piece of coaxial cable?

If you observed 20 Hz of drift over a half hour, after a 20 minute warm up,
I would be inclined to ask as to the ambient temperature variation during
that 30 minute exercise.

========

PP is just an identification for this size of battery like AA and AAA
for 1.2/1.5 V cylindrical batteries

>
> The polys have a generally acknowledged negative temperature coefficient and as such must be correcting for something. The inductor is an air wound solenoid, wound on a toroid or perhaps a (for the frequency range spec'd) quite long piece of coaxial cable?

=======

The Toko inductor with adjustable core is a canned component frequently
used by homebrewers and still available . It comes in 3 model for
various frequency ranges. In Europe (and that includes Britain ;)) it is
particularly popular by the QRP community.

> If you observed 20 Hz of drift over a half hour, after a 20 minute warm up,

==========
As stated in my previous message ,the above referred freq. drift was
observed at a stable room temperature. In fact it was in an underground
  civil defense bunker where a radio club is hosted by the local
Emergency Planning people(a sort of regional FEMA)

> NOT linuxed, have enough trouble with Bill Gates's products.
============================
Having problems with Bill Gates' bloatware is the best possible reason
to move to Linux ,which is free and can be freely and frequently updated
at umpteen repositories world wide.
It takes some effort ,since everything in Linux can be configured by the
users .   But that keeps the 'grey matter' in the head active .
Also Linux doesn't need the latest and fastest machine .
I run my system on a motherboard with a 1GHz Athlon processor and 1024MB
of RAM ,from AD 2001.
My advice : GOFOR Linux and enjoy !

No, it's the designator for the type of battery.  Just like there used
to be "A Cells" and "B Cells".  It's the common 9v battery, as he
explained.  They are simply refered to as "PP" in Europe, just as
they have A4 paper over there rather than the 8.5 by 11 inch paper
that's common in North America.

Get out the ruler, and you'll find that his dimensions match the
battery in your smoke detector.

Jack,

New chassis looks great, well done.

It looks like you have a white wire (Anode HT maybe) going to a meter
then through the chassis. This will need some serious de-coupling
(feed through cap) as it enters the chassis otherwise it is going to
radiate in the lower chassis which won't help with the stability
issues. A 'T filter' would be good here, 1mH above deck, a 10nF
feedthrough cap and 1mH below deck.

As Andrew mentions, you also have 'below deck' electronics 'above
deck' in the form of the VFO. This is going to need very tight
screening to avoid feedback and stability issues.

What frequency are you running this unit at - 14MHz ??

Any chance of some higher res photos looking from above the chassis
and from below ?

Regards,

Mark

To me that is a supercomputer class machine; linux kernel development
unfortunately is a moving target and your arrows had better be made of
recent generation silicon. For those of us who need to target old x86
(386, 486, PI, PII and PIII) and cpus in the embedded space, (ARM7, etc.)
I recommend researching the large number of alternative OSs available
including *BSD, OpenSolaris, various RTOSes like UCOS-II, FreeRTOS, eCOS,
opensource MS-DOS workalikes and others with much smaller footprints, for

amateur radio related work unless your intended user applications are
linux specific. If you are doing DSP or realtime development, I
urge you to consider an RTOS over any *ix.

The linux machines (x86, ARM7 and others) in my domain are all at 2.4.x
kernels due to the increasing requirements of newer kernel versions; in
fact I maintain some 0.9x and 1.x linux systems for special requirements
for their relative simplicity.

Regards,

Michael

====================================
This thread has moved off-topic ....my fault , I included the word Linux
in an earlier message .

To most users Linux is just one of many operating systems being an Open
Source replacement for Windows . Nothing more ,nothing less.

It is the result of a rare phenomenon ;'international cooperation' among
hundreds if not thousands of volunteering (usually professional)
enthousiasts across the globe, who through the Internet formed Linux
communities which continue to flourish. This has resulted in an ever
improving operating system now available in a variety of distributions
constituting ultimate freedom, no longer the sole domain of 'geeks' but
of ordinary computer users.
I am glad having embraced Linux.

Frank   GM0CSZ / KN6WH

I can't seem to find polystyrene caps in DigiKey. Poly everything but
styrene.

NPO and COG seem to be synonymous and are defined at +/- 30 PPM/deg C. I find nothing called zero TC and the vast majority say nothing at all about TC.

Here's mine but you probably won't like them.

What is the point of a blog? What does it do but detract from this group? I went there, read your interesting dissertation and would have commented but for having to sign up and putz with a web based format that is much less convenient than usenet or even yahoo.

Furthermore, unless you know some magic, you will never get more than a hand full participants.

....

I concur will all you said and find that the most interesting aspect of my renaissance in ham radio is being able to afford to buy real test equipment. Everything I did in my first life was with a barely usable multimeter, light bulbs on links and pencils for drawing arcs on RF nodes.

One thing that took me by surprise was the change in solder to the extent that I could hardly perform this most necessary craft when I ran out of 50 year old solder and bought a new roll.

It seems that Ralph Nader has barfed up this craft also. After finding a roll of real solder with tin and lead, things got a lot better. It still does not tin as neatly as the old stuff and most importantly, does not have that good old aroma that I recall from childhood.

I presume that what ever the current flux is, it just does not work or smell like rosin.

Any thoughts?

For the past two weeks, I have been noticing a burning smell coming from my rig   http://schmidling.com/radio.htm   when I buzzard.

I can not tell exactly which deck it is coming from but the power supply has no hint of the smell. This leaves the RF deck and the mod deck. I would have bet on the RF deck as it seems to come through the "window" (hole) in the front panel of that deck but a careful inspection shows not a hint of anything burning or even getting warm other than the tube. There isn't much there to get warm other than the fil trans and the little power trans for the bias supply and they are both cool to the touch.

This brings me to the mod deck and the only thing hot there is the fil trans. I have left the filaments burning for several hours and the smell never happens and the trans only gets moderately warm when not transmitting.

The mod deck is a pair of 813's, zero bias as triodes. The centertap of the fil trans is grounded through the meter.

The question is, what effect does the mod current have on the heat carrying capacity of the filament transformer? Are all 10v 10A trans equal? Does talking create heat in it and could this be the source of the smell?

Lacking a better choice, I bought it from Antique Ele for $54 incl shipping. Seems like a junky little thing compared to the one in the RF deck. It's a Hammond T167S10.

Any thoughts?

Sounds like the rumblings of a grumpy, stodgy old fart!

A blog is a very good venue for posting information that's dynamic and frequently updated. It's a good hybrid between a very focused special-interest newsgroup and a full-blown web site. It's easy for the author to update frequently and It allows a measure of interaction between the writer and the readers. It can contain graphic images and file content that newsgroups and news readers don't want to be bothered with. It's especially good for chronicalling daily progress on projects and other regular postings that a newsgroup might find to be tedious and arcane. You don't have to register yourself if you just want to read it, so I'm not sure what the 'convenience' ran't is about.

A blog definitely has a 'point', and a homebrewer's blog written by someone with Farhan's credentials definitely has a place and a value. Keep up the good work Farhan.

John
I sent an email to your QRZ email address about the transformer.

The German magazine Funk Amateur of April 2006 had a interesting design:
they modulated the oscillator with a 400 Hz FM and measure the oscillator
amplitude. At a 'dip' this is at a maximum. A can send a scan if you want
(in German of course)

I am building an amplifier

(for schematic see page 5 here:
http://makezine.com/09/crackerboxamp/
)

but when I turn up the gain, I get buzz and can actually hear some
radio broadcasts on it.

I assume I need to shield the circuit, or parts of it...

Would lining the inside of the project case (in this case a cardboard
cracker box) with aluminum foil work?

Incidentally, does anyone know if someone makes a type of "shielding"
spray paint or primer, that you could just spray on a plastic or
cardboard project box, that would provide shielding?

Any help appreciated...

Does anyone know where you can order motherboard LED type connectors
and posts like these

http://estore.asus.com/images/14-000014000.JPG
http://www.pctechguide.com/images/tutorials/SCSI/LEDConnector.gif
http://lib.store.yahoo.net/lib/directron/wircon7b.jpg
http://www.hardwaresecrets.com/imageview.php?image=628
http://www.infohq.com/Computer/CompGraphics/AthlonBuild/accessorycons.jpg
http://www.pcper.com/images/reviews/285/install03.jpg

Preferably at a good price, as I am looking to buy a bunch (a couple
hundred).

I have seen 2 or 3 pin connectors are pretty common on motherboards,
but I am mainly looking for one-pin connectors, if available.

I would imagine the posts may just come in strips of wire that you
would cut yourself?

Much appreciated...

Thanks for your reply.

I tried searching for LED connectors and get LEDs. I want the
connectors and posts, not replacement LEDs for a motherboard.

http://www.mouser.com/search/refine.aspx?Ntt=led+connector

What are these known by? If you can name some specific parts that
would help narrow my search, because I'm getting several
categories...

- LED Light Pipes & Mounting Accessories (81 Matches)
- Pin & Socket Connectors (198 Matches)
- Pin & Socket Contacts (17 Matches)
- Terminal Blocks (16 Matches)
- Terminals (93 Matches)

I just want the one pin connector type, with a wire attached, and the
post it would plug onto (which you mount or solder onto the PC
board).

Thanks...

Ah, yes, the connectors are general-purpose, and have nothing to do with LEDs specifically, although this is the context in which you happen to have encountered them; therefore searching on the term "LED" is leading you astray.

There are literally hundreds to choose from, but here are a couple example part numbers I pulled out of the Mouser catalog to point you in the right direction:

    Header: Mouser 517-2312-6111tg, 3m 2312-6111tg
    Socket: Mouser 517-974-01-02, 3m 929974-01-02 (board mount)

the sockets also come for crimp pin or IDC connections. I think once you stop searching for "LED" you'll be able to find things easily.

Male pin headers and female socket connectors with 0.1" pin
spacing. Also socket contacts (inserts) are often sold
separate from the socket itself.

They can be very expensive from electronics supply houses,
ridiculously so for the female connector and insert.

http://www.digikey.com/scripts/DkSearch/dksus.dll?PName?Name=609-2342-ND&Site=US
http://www.digikey.com/scripts/DkSearch/dksus.dll?PName?Name=609-2301-ND&Site=US

What exactly are you looking for? Straight plastic sockets
with 0.1" pin spacing but do they have to be the very thin
(black in your links) type such that on a row of pins in a

pin header, you could plug in two right next to each other, OR could the plastic connector body be larger like those used on fans?   The point is that if looking for an especially low price, one option is surplus electronics 'sites which may have something that would work (or may not) depending on the requirements beyond the basic # of pins, spacing and pin size.

You might find them called something else, generically grouped as just "connectors" or slightly more like "pin connectors" at a store/site that doesn't deal with as many connectors and just doesn't follow standard naming practices.

You might check the following surplus sites (and ebay).

That should be a big help - I just needed some keywords: header, socket, board mount, IDC.

This would be a way to make certain components (such as pots & trimmers, 1/4" phono jacks, switches, or other sub-circuits) "plug and play" for various prototypes + experiments. The motherboard size headers are small enough where the leads match the components I'm using and the pins on a motherboard that LEDs plug into are just the right size to plug into a solderless breadboard, but are more durable than the regular breadboard jumper wires.

>You might check the following surplus sites (and ebay).

Thanks again

> Did you use shielded wire to connect the controls and jacks?

Thanks for your reply...

No, just normal stranded wire. Is that where the most interference would be leaking in?

I found shielding paint (see below) - would it help to paint the inside of the project box with this?

http://www.lessemf.com/paint.html

SUPER SHIELD

Reduce or Eliminate EMI / RFI Interference

Super Shield A general purpose EMI/RFI shielding in a handy aerosol spray for use on most substrates. Especially good for RF shielding plastic electronics enclosures. Consists of a tough, durable acrylic base pigmented with a high purity nickel flake. One to two mil coating provides 40dB - 50dB shielding across a frequency range of 5 to 1800MHz. About 1600 in=B2/can coverage at 1.5 mil. Contains no CFC 'S, NO HCFC'S, ozone friendly. 340g (12 oz) aerosol can. Dries to a dull gray color. Click to see MSDS

* Surface Resistivity ~0.7 Ohm/sq
* Dry time: 10 minutes at room temperature
* Recoat time: 5 minutes
* Excellent adhesion to most plastics
* Tested as per IEEE Std. 299-1997
* Underwriters Laboratories Recognized File No.: E202609
* NO CFC 'S, NO HCFC'S, Ozone Friendly
* RoHS Compliant

Flammable aerosol, ships by ground only.

Super Shield (Cat. #A285) $24.95

Super Shield (Cat. #A285) $24.95
add to cart

For $24.95 plus shipping, that's some mighty expensive shielding. Why not spend about half of that and buy a proper aluminum chassis for it. They offer inherent shielding. You'll have to do a bit of easy drilling to mount the components, but it's well worth the effort, and it looks so much better than a cardboard box.
Surf over to www.mouser.com and search for Bud mini-box. There are quite a number of sizes available; one is sure to fit your needs.

Cheers!!

> add to cart

It would probably be little help. And if you coat the box=20
with anything conductive, it won't help much unless you can=20
make a good electrical connection between the coating and=20
pin 4 of the chip. If you really want to try this, thin=20
brass shim stock cut and folded to fit the box, is probably=20
the best you can get, short of a copper or aluminum box. It=20
is also easily solderable to make the ground connection.

If this amp powered by a battery?

In this configuration, pin 2 is the most sensitive node, and=20
anything connected to it should be surrounded with shielding.

Pins 1 and 8 are also somewhat sensitive so if the gain pot=20
has a metal case, that case should also have a ground wire=20
run to pin 4 to shield the resistive element.

Pin 7 is less sensitive, and since this circuit connects=20
nothing to it, it is probably not involved in the noise.

The 6BY6 was intended as a sync separator, and to run with 10V on the plate
at that voltage.  My bet is the 6BE6 would be the better tube to use unless
your PD is running at reduced plate voltage.

Don

Can the 6BY6 be used as a converter?  The whole thing about the 6BE6 is
that changes in control grid voltage don't affect the cathode current much.
If you're doing the self-excited oscillator trick, I think you need the
6BE6.

The 6BE6 has a transconductance, as an oscillator, of 7250 umhos while the 6BY6 has a transconductance of 1900 umhos, as a Class A amplifier.

Different critters designed for different purposes. Each will work in the other's circuit, but at reduced performance.

You can compare their specifications here:
<http://www.pmillett.com/tubedata/HB-3/Receiving_Tubes_Part_1/6BE6.PDF>

For use in a product detector, is there an obvious "better choice" between the 6BE6 and the 6BY6?

The 6BE6 seems more common and looks like it'd be better for use with AGC applied, but that's not how my product detector works, so I don't know if there's something else which is a determining factor.

The 6BY6 seems to have originally been intended as a sync separator for TV use.

Tim.

A diode ring mixer from Mini-Circuits?

Seriously, in the later publications that I have the move had started to balanced mixers -- I would investigate using a twin triode, or get one of those evil dual-plate steered beam devices (apparently they're susceptible to stray magnetic fields).

In my case there's no desire for using the tube as an oscillator.

I was just doing a survey of my radios yesterday and the number of
6BE6's stuck in sockets labeled 6BY6 was astonishing :-).

Some discussions in the ham literature indicate that the 6BY6 is less
prone to overload.

Tim.

Try NTEINC.com for a cross reference for the 01-043A transistor.
NTE-349 looks close, and the PDF for the device is available online.
```

The other part (BY1-1) seems incomplete, is there a Z or T after the 1? I think that was an older Acrian RF transistor. Those look like REPCO part numbers.

RF Parts shows the BY1-1 in their catalog. Perhaps they might be able to give you advice regarding the nearest cross reference if you email them.

Pete k1zjh

Hello Peter:
Thanks for your aid. The BY1-1 is a R.F. transistor  for P.A., made by
CTC, but I do not have but data. -
It will continue looking for. -
Greetings

There are a number of things that can be considered when using a tube as a mixer. I always thought the 6BE6 was more prone to microphonics than other tubes. That does not show up in the tube manuals.

It is certainly possible that the 6BY6 may handle higher signal levels as a mixer, even though not designed as one. Probably the best test is with a signal generator and in the actual radio.

Colin K7FM

Hi All,

For those interested in building an FSA3157 H-Mode mixer, I like to

inform you that Martein, PA3AKE, has added a page to his web-site with
the schematic and PCB layout (Eagle format) for the G3SBI 3T H-Mode
Mixer using the FSA3157. See:
9 - Appendix
o   FSA3157 mixer schematic and PCB layout
He has also added the I7SWX 2T H-Mode Mixer schematic to the 2T page.
See:
5 - Homebrew transformers
o   BN43-2402 2-Transfomer H-Mode mixer
These can be found here:

http://www.xs4all. nl/~martein/ pa3ake/hmode/

Enjoy the visit and best 73

Gian

I have about 15 sets of 100 pieces of Motorola PN2222A that are surplus to my needs.

I am asking for $6.00 a set, no shipping charges to the US

There are genuine, new, never used, Motorola parts on paper tape.

Paypal is preferred: orders@hamradparts.com

In the famous HBR receiver design by sk W6TC, the product detector was a
6BE6 in the original circuit, but he later changed it to use the 6BY6
claiming that it gave better performance with less cross modulation and
overload.

Here is the link to the HBR receiver tube lineup
http://www.qsl.net/k5bcq/HBR/hbr.html#Tube
showing the use of the 6BY6 as a product detector.

I am in need of zero tc caps for my VFO project but can't seem to find any info on them. Who makes them? What are they called?

Digikey has some with tc's of 200 ppm but that aint zero.

The also have some that are 0 +/- 500 ppm and that makes no sense.

I need two at 1000 pf.

Thanks,

js

I have tried this
The best converter's zaps a single 9 volt battery in 5 minutes, to much
current
You need to use ten - 9V in series.
I have even tried some Mouser VCR display converters they dont have enough
current.

If I am correct, they are nomenclatured as NPO types. Mouser list NPO caps.

Ceramic capacitors with nominal zero temperature coefficient are
usually called C0G nowadays, but sometimes the older term NP0 is
used. There's lots in the Digi-Key catalog (mostly surface mount mind
you...if you are looking for through-hole parts).

Don't forget, a lot of the drift is caused by the inductor in the resonant circuit, and it will have a positive coefficient. Most VFOs have some compensation using a cap with a negative temp coefficient to compensate.

Pete

Look for C0G ceramic caps, or silvered-mica caps. They both have low temperature coefficients. C0G are normally maximum 30ppm/C. As Uncle Peter suggested, the inductor will normally have a positive temperature coefficient of inductance -- it's easy to see why for an air-core inductor, since it expands and gets bigger as the temperature increases. You can use C0G for much of the total capacitance, and combine that with a cap with a negative temperature coefficient--if you can find one--to get a very low net temperature coefficient of oscillator frequency. These days, it's fairly common to stabilize a VFO with a phase or frequency locked loop, so it becomes mainly short-term stability that you care about in the oscillator design.

Cheers,
Tom

I'm working on a homebrewed receiver and am looking at using the
LT5512
as the mixer. I'm not sure of how to arrange an impedance match and
unbalance to balance conversion over a wide range. Perhaps people
can comment on the following so I can see if I'm on the right track.

The LT5512 datasheet says:

Frequency	Impedance
10MHz	18.2 + j0.14
240MHz	18.1 + j2.8
450MHz	18.1 + j5.2

One simple approach seems to be:

```
  50 ohm input -   -----------   -----------|---------- IN+
                ) (           ) (          ___
                ) (           ) (- ground  --- 6 pF         LT5512
                ) (           ) (           |
        ground -   -----------   -----------|---------- IN-
                3:1           1:1
              Coilcraft      Coilcraft
              WBC3-1TL       WBC1-1TL
```

The 3:1 transformer converts the unbalanced 50 ohm input to 16.67
ohms.
The 1:1 center tap transformer converts the unbalanced 16.67 ohms to a
balanced 16.67 ohms. The center tap also supplies a DC ground for
biasing the LT5512 inputs. The 6 pF capactor reactance is:

Frequency	Reactance
10MHz	2652.58
240MHz	110.52
450MHz	58.95

placing it in parallel with the LT5512 inputs results in:

Frequency	Impedance
10MHz	1/(1/(18.2 + j0.14) + 1/2652.58) = 18.21
240MHz	1/(1/(18.1 + j2.8) + 1/110.52) = 17.58
450MHz	1/(1/(18.1 + j5.2) + 1/58.95) = 16.7

Questions:

1) How off base is my simple analysis?

2) Is there a better way to do this?

3) How significant is the 1.6 ohm mismatch at 10 MHz?

-- John

I'm working on a homebrewed receiver and am looking at using either
the
AD8343 or LT5512 as the mixer.  They seem very similar in
capabilities.
The AD8343 appears to have slightly better LO to IF port isolation but
a more complication input biasing.

What the tradeoffs of using the AD8343 vs LT5512 for converting
.5-600 MHz RF to 140 MHz IF?

Hi There,

The Bishop Druit College Radio Club
http://www.qsl.net/mm0axl/mncarg/bdc.html
situated in the Mid North Coast of NSW Australia at Coffs Harbour are
looking forward
to making Local or DX IRLP contacts on Fridays 0315 - 0345 UTC.

Contacts will be on IRLP node 6625 via local repeater VK2RDO on 146.650Mhz.

The young people in the club have been experimenting with building simple FM
radio recievers, and have been contemplating the design of plasma balls
using ordinary light
globes and car spark coils.

Contacts with interested parties or similar school electronic/radio groups
would be great but unfortunately the club only has limited time during the
local
lunchtime period.

If interested and can help arrange a contact please email:

Gary VK2ZKT gryan@bdc.nsw.edu.au

or

Peter VK2EVB vk2evb@wia.org.au

```

There's no need to worry about such a small mismatch. Especially if you will be connecting the antenna directly to the input, you're pretty much guaranteed that the source won't be 50 ohms at any but a very few spot frequencies. It will have reactance and resistance that varies all over the map. But even if it's driven from an amplifier, I can guarantee that between the transformer(s), the layout, and the amplifier itself, you won't have a match within 10% over very much of that wide band.

You can use the freeware RFSim99 to play lots of "what-if" games, including seeing how much loss there really is for various impedance mismatches. RFSim99 also comes with a program called "spur search" that you may find useful in indentifying mixer spurs (and intermod products).

In any event, you likely will end up being more interested in the noise figure than in the power match; you'll want to match for lowest noise, which is essentially never the same as matching for best power transfer.

Another thing you should be careful about is selectivity: if you let everything from the AM broadcast band up through UHF TV into the input, you will be letting in some big signals along with the presumably small ones you will be interested in, and distortion products will limit what you'll be able to hear. It's customary to put some selectivity ahead of the first less-than-stellar-linearity parts such as that mixer. If you had a +65dBm input-referred third order intercept, I'd say you could probably do without the selectivity, but much less than that and you'll benefit from selectivity. There are times when you can't do that, like if you want to digitize a wide bandwidth all at once, but it doesn't sound like that's what you are after.

There are some good books on modern receiver design. Maybe your library has one or could get one for you. Even a quick review of the key issues would probably benefit you, if you haven't already done that.

Cheers,
Tom

I am building an exciter for my 8000 rig. 6AG7 VFO, 6CL6 buffer and 807 final.

I am plagued with the problem that resonance in the final does not agree
with peak power out.

The power peak (watt meter or light bulb) is a considerable twist south
of the plate current dip.

Looking at the output on a scope shows nothing strange about the wave
shape as the amplitude increases beyond the dip.

I have tried neutralizing with coupled links between the input and
output tanks but it makes no difference nor does anything else I have tried.

Any ideas would be welcome.

Jack K9ACT

Hi Jack,

Have you tried the PA without any excitation ?

Do you have an APC in the anode line, and an approprate RFC to HT
(with good decoupling to chassis) ?

How about grid stoppers ?

Regards,

Mark

Jack, am a believer in the grid dipper,double check the buffer and PA
tuning ,make sure that they are on frequency and not doubling .If 807
has Pi network,make sure cap C1 nd C2 are in ball park for tuning
range of each band..Handbook wll give these values...Unplug 807 and
make sure the 6AG7 is on freq and on resonance.. think you hae a good
choice with tube lineup.just need to get it to settle down...GL   73

Anyone build the near earth model rocket telemetry project from QST?
Seems to work well although I have not launched it yet.

It would help to get more details from you. What frequency is all of this for? Link-tank output? Or pi-network? Are the coils of the tank/pi-net according to specification (from some plans)? Do you know that the VFO is on frequency? Are you doubling in the 6CL6?

> I am plagued with the problem that resonance in the final does not agree with
> peak power out.

Can you removed B+ from the VFO and twist your driver and final tune knobs and get dips in plate, grid current (signs of self-oscillation)? Do you generate grid bias in the final from a grid power supply or rectified drive power?

I have had some experience with matching networks between the final and the load having slight disagreements between peak output power and maximum dip in plate current. Not to worry if the difference is slight.

Most important: find out if the final is self-oscillating (remove drive and rotate final tuning knob to see if there is any wiggle in plate current at any point).

> The power peak (watt meter or light bulb) is a considerable twist south of
> the plate current dip.

What is a considerable twist? five degrees of arc? or 45 degrees of arc? What is your load? Dummy load?

> Looking at the output on a scope shows nothing strange about the wave shape
> as the amplitude increases beyond the dip.

All sine waves should look like sine waves.

> I have tried neutralizing with coupled links between the input and output
> tanks but it makes no difference nor does anything else I have tried.

This can be very difficult to do. If your frequency is HF or low HF you shouldn't have to do this. Most old commercial HF tube rigs did not have neutralization and they worked fine.

> Any ideas would be welcome.

You do have the screen grids grounded through good RF bypass capacitors, right? Once I forgot to add these to a 6146 amp and it self-oscillated at 160 meters (it should not do that) until I put in a good screen to ground bypass capacitor.

Another area where you have to look out for a mistake is if you have the coil/inductor at the grid input of the final located where it can pick up the magnetic field from the final plate output coil/inductor, which can contribute to making the final just a self-excited oscillator.

So, the next question is: if you get a dip in the final plate current at some position of the plate tuning capacitor, then does that final plate current change if you also tune the grid input capacitor? If yes, then your final has a configuration to make itself a self-excited oscillator, and the next thing is to look for how feedback can be contributing to that.

What's APC?
>
> Any chance of a photo to look at construction techniques ?

Sure. http://schmidling.com/807a.jpg

Needs a little cleaning up. Note the careful placement of the grid coil
at right angles to the final and with the Masonite panel between for
good shielding.

Hi Jack,

Grid stoppers: A low value resistor (100 ohms) attached directly between G2 and the screen supply to reduce the incidental Q of circuit. Same applies to G1.

APC - Anti Parasitic Choke. A few turns (10 ?) of 22AWG enameled copper wire around the out side of and terminated with a 10 ohm 1W resistor. If the AMP becomes unstable at VHF, the reactance of the small inductor will increase and the 10 ohm resistor will dampen the mayhem.

See http://www.somis.org/Oct88qst.html

>From your photo, I think you may need to considerably reduce the length of your wiring before you should tackle stability issues. Anode circuits should be above chassis, grid below chassis and never the twain should intertwine. It looks like you make have lots of inductive coupling between the two at the moment (long wires etc.) which may well be the cause of your problems.

Also take care of proper de-coupling - directly to chassis with minimum lead lengths (1 inch max ?).

Get a 1960s copy of the ARRL handbook and read up on HF amplifier construction techniques. There has been plenty written.

Regards,

Mark.

I have read that these are better built with a bit of resistance wire,
because the inductor is reputed to sometimes work too well.

I dunno the details though -- all my work ends up being QRP, so I
haven't had occasion to make such a beastie.

OK but the supply is a 12K resistor from the plate supply. Guess I
don't see what a 100 in series with this would do.

>Same applies to G1.

Where does that go? There is a 47K grid leak going through the meter to
ground and a coupling cap from the driver.

So what is this grid stopper supposed to do?

> APC - Anti Parasitic Choke.

Roger. The A caused a brain cramp. I have one in there.

I have 49, 57, 61 and 73 one of which I take to bed with me every night.

Hi Jack,

See if you can find a project called "A 75 to 120 Watt CW transmitter"
in any of your ARRL manuals, (1973 ?).

Z1 is the APC, RFC4 is the anode RFC, there is a 10R grid stopper on G1 (pin 5), Decoupling abounds (including the heaters), band switch shorts unused turns of the output inductor, top chassis shows anode wiring only, bottom chassis shows grid and drive electronics.

I haven't read the whole article yet, but it seems like a well designed beastie and a good starting point.

Keep a change of fresh underwear next to the rubber gloves :)

Regards,

Mark

ERK! - looks like a 6146 PA, rather than an 807. And, congrats at the attempt, (LOVE the agricultural look - wheres the PTO for the chaff cutter?) BUT theres too much loose wiring providing stray coupling paths - AND you do need to use a metal chassis, even if only to separate the input/output circuitry. A piece of light gauge aluminium sandwiched(sp?) on top of your present chassis would do it.....easy to work with simple tools, no bends.....or do what the old timers did, go to the supermarket, buy a sheetmetal baking tray from the Homewares section)

BTW - while your there, buy one of those cheap white plastic kitchen cutting boards - easy to work, a lovely source of insulating material for standoffs, insulators etc...

And whats with the 3 big wire wound resistors? - screen supply to the PA - what a potential source of stray coupling. A 1 watt resistor is usually sufficient, you wont need the string of 10 watt ones.... (especially sitting under the lead from the anode of your PA stage..) And the anode tuning is about 100 yards from the tube! - can you get it any closer?

So saying all that, general rule of RF stability is to bypass EVERYTHING, including any existing bypass circuitry. (This is why a metal chassis is so good...no long leads on bypass caps)In this HF cct, a handful of 0.1 or even 0.01 caps would be a good try....wack em everywhere. Go buy heaps, they will be most useful for other stuff as well. 630V polyester/polystyrene are easily and commonly and cheaply available...

And keep going - its worth the effort -

Andrew VK3BFA.

Hi Andrew,

Yes, the example I quoted was for a 6146, but same construction and
circuit elements apply.

I just wanted to give concrete examples of the elements I was talking
about.

-M

Transmitter in the 1967 ARRL HB used a 6146 in gk on 6m.
The input circuit was 9 turns of #20 spacewound 5/8" dia.
It was center tapped, with the center tap connected to a 7uh
rf choke, other end of the choke was grounded to bias supply
(or 22k 1w resistor for grid leak bias, class C). One end of the
coil goes to the grid of the 6146. The other end of the coil is
connected to ground via a 30pf tuning cap, and also to a probe wire
that serves as one 'plate' of the neutralizing capacitor (the plate
of the tube is the other capacitor plate). This probe wire is simply
moved near the tube till adjustment of the plate tuning capacitor does
not vary the grid current, this indicates the tube is neutralized.

The three cathode connections of the tube are connected together at the
socket by a "Y" shaped piece of copper, this is then grounded at a
single point.

Looking for a dead band module (any one OK...28, 50, 144, 220, 440 or
1200).  All I really need is the case...guts not needed (except the
connectors, etc. that interface with the "mainframe").  Send me an email
with what you have and what you want for it.  Low bidder gets the job!  ;)

THESE TIRED TO WORK HARD AND TO HAVE SINGLE MONEY TO PAY ACCOUNTS OR SOMETIMES NOR FOR THAT? THE MONEY IS FOR ALL AND A HARD WORK DESERVES AN EXCELLENT ONE IT PAYS! I OFFER YOU TO BE PART OF THIS AID IN COMMON, BECAUSE THE UNION MAKES THE FORCE, PROVES THE FORCE OF SOLIDARITY BY INTERNET, AYUDATE AND AID TO THE OTHERS PLEASE BEFORE ELIMINATING THIS WARNING, WOULD BE THANKFUL THAT LEA FIRST AND IT MAKES THE DECISION LATER. THIS IS NOT A SWINDLE, IS NOT ILLEGAL, IS NOT NECESSARY TO ABSOLUTELY SELL NOTHING, IS FOR SLUGGISH IS FOR PEOPLE WHO NEED AID AND WANT TO HELP THE OTHERS. MAKES SAFE MONEY LEGALLY, FAST AND VIA INTERNET! MAKES SAFE MONEY LEGALLY, FAST AND VIA INTERNET! (Suggestion: It prints this one article so that it reads it with thoroughness and thus it can include/understand it better and follow his form step by step of application.) HELLO TO ALL. - You need a car, to pay to the initial of your house or department, to pay education of your children, you need very deserved vacations, to lamentably begin a saving or any thing for your family but your pay only reaches to pay the accounts sometimes and nor after that. If you identify yourself with previous, the welcome thing to the club, if in addition you are conscientious that stops to win money is necessary to work always honestly, then east business is for you. It says thus: ORIGINAL MESSAGE While it sailed by these pages of the news, also like you it is doing it now, appeared to me an article similar to this that it said: You can gain thousands of dollars in few weeks with an investment of U.S. $6 dollars (six dollars). Immediately I thought: " OH, no! , another swindle more? ", but like majority of us, the curiosity could more, and I continued reading, and it continued saying: "You will send U.S. $ 1,00 (a dollar) to each one of the 6 names and directions mentioned in this article, later You will write down your name and direction at the end of the list having replaced to I number # 6, and it will at least send or put east article in 200 NEWS GROUPS (there are million of these anywhere in the world). " Note: If one is in another country, must exchange his national a dollars, because in all the countries they change dollars and is easier for all. For that reason we will make this business only with dollars and not complicaremos us. Any trick, the difference from this system to others does not exist, is that you have a list of 6 instead of 5, this means that your average of gain he will be After thinking it time and time again and to consult it with friends, I decided to prove it, I thought that the only thing that it could lose era the value of 6 stamps and U.S. $6 dollars and that it would take it like an investment, truth! I thought that to invest 6 dollars plus the costs of shipment by mail they were a compared triviality with which I give in my work by a pay which I am thankful but that it is not sufficient nor just. As probably many of us were a little worried about the legality about all this. Then it consults to the Central Mail and they confirmed to me that in fact he was totally legal. I remained astonished and I invested to my U.S. $6 dollars immediately... IMAGINENSE THAT! ... the few days later, I began to receive MONEY by mail! Was happy, like boy with new toy, and very surprised! And it thought that this would finish more in few days and tries to forget to me the subject, in any case already had recovered the investment, but the money continued arriving. In my first week I made between U.S. $20 dollars and $30 dollars. For the end of the second week it had made a total of U.S. $1,000 (thousand dollars)! PODIA NOT TO BELIEVE it! ; in the third week U.S. $10,000 (ten thousand dollars) and still continued arriving more! ; in my fourth week had a total of U.S. $41,000 dollars and this continues arriving more quickly (in my house, they go it opening you exceed and I obtaining "NEWSGROUP". THIS WAS PUT SERIOUS. All this was worth the trouble, the investment of U.S. $6 dollars and 6 stamps, gave its fruits, and to think that I spent more of U.S. $6 dollars weekly in drawings and lottery, and did not pass anything. The truth is that this can pass as long as works conscientiously and placing this warning in the greater possible amount of newsgroup, this works simple, while more people see it, more money I win, but even so I assure to you that you will win much more that putting 6 dollars in the best bank of on credit fixed world of 1 year. You will be receiving money worldwide, of places that nor know and in few days! Possibly he will want to rent a PO. BOX. By the amount of you exceed that it will be receiving. ASEGURESE OF WHICH ALL CORRECT DIRECTIONS ESTEN. Now So that of all this (IT IS WHAT IS GOING IT TO LIKE): Of 200 publications of this one letter in different newsgroup, we say that single receipt 5 replaced (IT IS NECESSARY TO BE PESSIMISTIC). Then I made US$5 Dollars with my name in the position #6, of this letter. Now each one of the people who sent the dollar, also makes a number of 200 publications of this one letter in different newsgroup and single 5 people to each one of the 5 original ones respond, this makes U.S. $25 more than I receive (up to here already I recovered my investment more and), now these 25 people put a minimum of 200 publications of this one letter in different newsgroup with my name in #4 place, and single 5 replaced of each one are received. It would be making other U.S. $125 additional, now these 125 people put a minimum of 200 publications of this letter in different newsgroup with my name in #3 place and single one receives 5 answers each, I I receive an additional one of U.S. $625, OK, Here this the part but amused, each one of these 625 people place puts their letters with other 200 publications of this one letter in different newsgroup with my name in #2 and each one receives only 5 answers. This causes that I receive U=2ES. $3.125. However these 3,125 people sent their letter and in addition they published this one letter in 200 different newsgroup, with my name in #1 place, and only 5 people respond of the 200 newsgroup, this does that I receive U.S. $15,625 dollars. Of an investment of U.S. $6. - dollars, do not think that he is FABULOUS and as I before said, that single 5 people respond of 200 newsgroup, (the real average is of 20 to 30 people) . IF THEY WANT THEY REMOVE CALCULATIONS! IF SINGLE 15 PEOPLE RESPOND .... THIS WOULD BE EQUAL A: In the position #6 =3DUS $ 15,00. - In the position #5=3DUS $ 225,00. - In the position #4=3DUS $ 3,375, 00. - In the position #3 =3DUS $ 50,625, 00 - In position #2=3DUS $ 759,375, 00. - ((((Now the good thing comes, not scare. - In the position #1 .... (((((U.S. $ 11.390.625, 00))))) ... if, ELEVEN MILLION DOLLARS or EUROS! This is the power of the multiplication of the capital to which all we have right! As I said, this can happen but it is necessary to work intelligently and each one of us must fulfill putting this warning not in 200 but in 400 newsgroup, to send post office to everybody, to make marketing, etc. and all gratuitous means of the powerful Internet virtual, in the end your work will give fruits because you worked with effort, honesty and transparency. Once its name no longer is in the list, removes the last announcement from the newsgroup and sends other U.S. $6 dollars to the names in that list, putting its name in the place # 6 and soon will return to repeat all the process, and to begin to put them in the newsgroup again, which must remember is that million people like You and like I anywhere in the world, they are connected to Internet daily and therefore some will read these articles, so I believe that nobody will have problems to invest to U.S. $6 dollars, and to see if this really works. Some people get to think...."and if nobody responds" ..... to me as it is the possibility that this happens? , if there are thousands and thousands of honest people (who, as we) they look for a way to have financial independence and to pay accounts! , and they are arranged to treat, because "THERE IS no WORSE FIGHT THAN, THE ONE THAT NOT FOR! ", esteem that are 20,000 to 50,000 new users of INTERNET Every day, (in all world). ** REMEMBERS, HAGALO IN HONEST, CLEAN FORM AND CORRECTLY, THUS IT WILL WORK WITH COMPLETE CERTAINTY. By the way: if you it defrauds to the people, putting messages with his name and it does not send any money to the others in those lists, you you will not receive ANYTHING almost! SO THAT ALL THIS HAPPENS? BECAUSE IT IS NOT HARVESTED WHAT NOT SOWING. REMEMBER, HAGALO IN HONEST, CLEAN FORM AND CORRECTLY, of way so that it wins money and does not squander the time, if it does, will receive money of all the people who enter this business will obtain positive results, at heart these money are turning around the world, and the people that will thank for it, are the pluses needed anywhere in the world (I do not say of extreme poverty), but people, who by those things of the life are in jams and this them aid to come out ahead. "A THING IS SAFE TO THAT YOU SEND TO HIM ON WITH 1 DOLLAR, BY COMMITMENT VERY SURELY IT WILL PUBLISH TO YOU IN HIS NEXT LISTS IN THE NEWGROUPS AND BY CONSEQUENCE YOU WILL RECEIVE MORE MONEY "... MUST FOLLOW THE RULES OF THE BUSINESS, OR BUT IT WILL SEE ITSELF VERY AFFECTED BY PEOPLE INESCRUPULOSAS, LUCK FOR ALL! You aseg=FArese to print this article NOW, to remove all the information as she needs it. The process is very easy and consists of 3 (three) simple steps

STEP N=BA 1: Obtain 6 sheets of paper and you write in each one of them "PLEASE INCLUDES MY NAME IN HIS LIST OF CORRESPONDENCE Or e MAIL" or "PLEASE ADD MY NAME TO YOUR LIST". Soon, its name also writes, direction and (OPTIONAL: electronic mail or email). And if it wants as a pretty detail also places in which POSITION appeared each name of the people of its List when You sent your DOLLAR (Ej.: "He was in the 3 position" or" You were in slot 3 ") like making it more complete. That one is, to make money and to pass it well at the same time, everything with good will. Now it doubles this one page where the previous thing has written, around a bill of 1 dollar American, it does not send to checks nor another type of payments, single American Dollars. P=F3ngalo everything within 1 on and m=E1ndelo to each one of the 6 listed people, the idea to double the paper around the dollar is for assuring that it is going to arrive at his destiny and THAT IS IMPORTANT. Of another way the people who work in the mail could detect that she is money and to remain with the THOUSANDS of YOU EXCEED that they are to him arriving; so that she recommends herself to surround everything, additionally, in a dark paper or of coal so that she does not see herself through on. What this doing is to create a service and like so, does COMPLETELY LEGAL. From now on this not sending a EURO or DOLLAR to him to some person without any reason, this paying to a EURO or DOLLAR by a legitimate service (I assure to Him, again, that this is completely legal). Immediately afterwards, it sends the 6 you exceed to following directions:

1=2E Guillermo Jimenez Ramos Urb. Villas de Feliza 154 Calle Lucy
Boscana
Mayaguez, Puerto Rico 00680-7301
 2. Mirta Weise. Calle: Eustaquio Fr=EDas 4361(Ingeniero Pablo Nogu=E9s)
C=F3digo Postal:1613 Buenos Aires Argentina
3=2E Jaime Cruz Ravelo Calle 69 Sur No. 102C-24 Bq 6 Apto 307 Ciudadela
La Libertad II Etapa Bogota D.C. (Colombia)
4=2E Edgar Fernando Gerardo Moreno. Calle Tarento 116 Entre Roma y
N=E1poles Cluster 12 Col. Hacienda Santa F=E9 C.P. 45655, Tlajomulco de
Zu=F1iga, Jalisco (Mexico)
5=2E Ursula Maria Mora Devoto. Calle Manuel Quiroz 180 Dpto. 208
Santiago
de Surco, Lima (Per=FA)
6=2E Olga Vargas Egusquiza. Calle Leon Velarde 115 Urb. Los Libertadores
San Martin de Porres, Lima (Peru)

VERIFY OF WHICH ALL THE DIRECTIONS ARE CORRECT. STEP N=BA 2: Now it eliminates I number #1 of list of above and moves the other names a number upwards (#6 becomes #5, and # 5 it turns #4, etc...) and it adds his NAME AND ITS DIRECTION like #6 of the list. STEP N=BA 3: Change everything what creates advisable of this one article, but deal with to maintain it the closest possible thing to the original one. Now it puts his article in at least 200 NEWSGROUP (exists more than 24.000.000 newsgroup), single need 200, but the more it puts, the more money him it will arrive. STEP N=BA 4: THIS STEP IS OPTIONAL: You also can send this article to other well-known people or strangers, relatives or friends through electronic mails or e-mails; for which such You will have to make steps previous and in addition to add its email to the correspondence direction and simply to send this article by email or sticking it like message of text or like attached file. Important: Remember to select, to copy and to stick solely the article or letter of format HTML of the message! NOTE: "OF COURSE, NEWSGROUP CAN SEE THOUSANDS IT or UNTIL MILLION OF PEOPLE WHEREAS an ELECTRONIC MAIL SEES IT THAT or WHO THEY RECEIVE IT ". Here some indications of how introducing itself go to newsgroup: THIS IS IMPORTANT THE MAS PART OF THE BUSINESS OF PLACING THE WARNING WITH TU NAME NOT IN 200, BUT I PROPOSE TO YOU TO PUT IT IN 400 NEWGROUPS OF AS AT LEAST HALF IN EXTRAJEROS. HOW TO HANDLE the "NEWGROUPS in simple steps. N=BA 1. - You do not need to write up all this letter to do hers own. He only puts his cursor in the beginning of this letter, clicks and he leaves it pressed and b=E1jelo until the end of the letter and larguelo. All the letter will have to be "shaded". Then, note and clicks in "Edit" or "edition" it arrives of his screen, selects here "to copy" or (Ctrl +C). This will cause that all the letter is in the temporary memory of its computer. N=BA 2. - Notepad" or "Word" Opens to a new file "and takes the cursor it arrives of the page in target, Presses "edit" and of the menu it selects "paste" or "to beat" or (Ctrl+V). Now it will have this letter in his computer and will be able to add its name in the place #6 of the list following the instructions of above. N=BA 3. - This letter in its new file of notepad like "txt Records Case out " or "text file", and whenever it wants to change something, it will be able to do without problems. BEFORE PUBLISHING THIS ARTICLE IN ANY NEWSGROUP, IT REMEMBERS THAT ALL THE WEBSITES HAVE DIFFERENT INSTRUCTIONS TO PUBLISH ARTICLE IN ITS NEWS either GROUPS or NEWSGROUP the BEST thing IS THAN THEY FOLLOW INSTRUCTIONS OF HOW MAKING IT NEXT VERAN SOME SUGGESTIONS; THESE CAN VARY ACCORDING TO THE VERSIONS OF PROGRAMS, WEBSITES, ETC. FOR WHICH USES INTERNET EXPLORER. IF NO IT KNOWS MUCH OF FORUMS, IT CAN USE THE GOOGLE TO LOOK FOR NEWSGROUP AND BEGINS TO LOOK FOR WHERE TO PLACE ITS WARNING. N=BA 4. - Go to newsgroup and you select "post an article" or "to write new message/discussion " in some newsgroup first is selected specific group and later loads the article in publishing new message. N=BA 5. - The complete content of txt Marks. case out and you copy using same previous technique. Return to newsgroup "TO NEWS" and "IT STICKS IT" there you this creating and filling with paste this letter within its program or "posting" Presses the button "post" FOR WHICH THEY HANDLE NETSCAPE. Within the Netscape program, it goes to the titled window "Window" and select " NetscapeNews ". Then it chooses of the menu "Options", select "to Show all Newsgroup" Immediately will appear a list of all the newsgroup of their server, click in any newsgroup. Of this newsgroup it clicks underneath "TO NEWS", which would have to be it arrives, in the left end of the newsgroup page This him it took to the box of messages. N=BA 6=2E - Fill east space. This it will be the title that will see all when cross by the list of a group in individual for example puts WINS SAFE, FAST AND LEGAL MONEY SINGLE 6 DOLLARS OF INVESTMENT. Mark complete content of txt cases out and copies using the same technique previous. Return to newsgroup "TO NEWS" and you this creating and filling with paste or sticking this one letter within its program or "posting" N=BA 7=2E - Press "send", that this in the left superior part and you have finalized with its first newsgroup. .... CONGRATULATIONS! Everything what must do is to put in different Newsgroup (groups) and to publish this one letter or article; when it already has practice, single will take about 30 seconds him by each newsgroup. One it forms to find NEWSGROUP, it is through the finders and Servants of the News. REMEMBER: WHILE MAS NEWSGROUP OBTAINS, MAS MONEY ANSWERS WILL RECEIVE! BUT IT MUST ENTER AT LEAST... 200 NEWSGROUP. AND ALREADY THIS! Single a note more, if it knows to translate this message to other languages (it can make it with the Tool Language of Word or by Internet), can in addition, to insert them in forums of different countries like, the USA, England, France, Germany, Russia, Brazil, (this I say it like advice to expand the possibilities that he sees much but people it), imagines that their mail sees it in China.

I thought the "Masonite shielding" would suffice for a smiley.

That was my first attempt at a wooden chassis and it became obvious why metal is better and I abandoned it a few weeks ago.

It started out xtal controlled but then I got the bug to add a VFO which is the crap on the left. The 807 turned into an 866 so I substituted the 6146 till I got another 807. The missing meter was a hamfest special that bounced so much it was useless and then crapped out completely.

It is now all neatly mounted on a home made aluminum chassis and unfortunately looks a lot better than it works.

I will take a for real pic tomorrow. That one was just too good not to share.

> And whats with the 3 big wire wound resistors? - screen supply to the
> PA - what a potential source of stray coupling. A 1 watt resistor is
> usually sufficient, you wont need the string of 10 watt ones....

One of the plans I was working for called for 25W. Seems like a misprint because it does not even get warm. The 10K in the VR150 leg gets hotter than hell and probably should be 25W. I burned my finger just checking it.

>And the anode tuning is about 100 yards from the tube! - can you get it any closer?

If you look closely, you can see the 807 socket between the 6146 and the cap. The 6146 is where the other 6ag7 is supposed to be.

> And keep going - its worth the effort -

It's been a challenge. I made a simpler version of this as a kid and am sort of re-living my childhood. It's like a Mr Wizzard Science project for me.

I am now plagued with real test equipment and can't play "ignorance is bliss".

>
> I thought the "Masonite shielding" would suffice for a smiley.

It did - I just didn't want to spend the next 3 weeks figuring out how to put one in.....(bloody computers)

And thanks for the explanation - I didn't see the 807 socket, and didn't know there was a VR150(was it?) in there as well. And the extraneous tuning stuff to the left, well, now I know its for a VFO. (Gee, voltage regulation - thats getting fancy - yes, the dropper resistors do run stinking hot, don't they....)

Strangely enough, theres a fault in human design in that the nerve endings that detect heat are a lot bloody slower than everything else - by the time we figure out its too hot, the damage is done....

And must admit to wallowing in nostalgia - mine attempts were similar, and probably oscillated all over the place as well - BUT without virtually any test gear, (or knowledge) it didn't seem to matter - there was no one to complain anyway, the bands were virtually empty except for other manic experimenters, TV was black and white, and broadcast was AM. Nothing else to get into - and the bands were harmonically related so we we're QRM other hams anyway....2m was the outer frontier anyway, there was NOTHING used above that....

How about a photo of the latest metal attempt? - remember, if it looks nice and neat, it doesn't really matter if it don't work too good....

I have things here I am not game to connect to the spectrum analyser - don't want my dreams shattered toooo quickly....
but getting back, more and more, into the older stuff - partly fading eyesight (I cant see u-mini smd ic's) and besides, theres something comforting about the warm glow of valves in a dark room, the crash of static from the other side of the world, the thrill of hearing someone on air from an exotic National Geographic land...the reasons we got into amateur radio in the first place..

The bands here at the moment are a total write off everywhere - 80m is S9 noise, the rest not much better. QRM, QRN wall to wall. So, I sit here and type on a keyboard, I guess its still "hamming" after a fashion...

>
> That was my first attempt at a wooden chassis and it became obvious why

Yep. Tubes with gain killed wooden chassis.....

>

Hah! - silly man - NOW you have to get the VFO stable, as well as all the other problems. And as for 807's - I think about 90% of the people reading this will have some sitting around, just waiting for the "magic moment" of inspiration. Good On Ya Jack - your doing it - good luck!

And the magics still there, even after 30 plus years of experimenting........cant be killed by the internet, store bought gear, mobile phones - all those glittering toys that didn't even exist exist when we started out.....

And I got boxes of hamfest meters that are probably crappy too - haven't tried to use them yet, so don't know. Finally built myself a rough tube tester a few weeks ago (I had to, trying to find working tubes for a VERY elderly Yaesu FTDX400)

Yep. Its a real PITA that - we cant delude ourselves our home brew QRM generators are not what they are.....still, its an excuse to use some time creatively.......

Hi all,

following my message inserted on may 24th : "Better to use AD9912 and not AD9910", I have received several enquiries about any test done on the AD9912.

Yes, my good friend Giuliano, I0CG (of AD9951 DDS fame), is performing measurements on the AD9912 and also comparisons with his already well known and appreciated DDS using AD9951 and a 500MHz clock.

I have uploaded a document in:
http://groups.yahoo.com/group/emrfd/files/
http://www.hamsdr.com/dnld.aspx
http://groups.yahoo.com/group/softrock40/files/

with title: "AD9912 SFDR tests.pdf "

The document reports some Spectrum analyzer measurements on the AD9912 and also one comparison with AD9951.

When I0CG will release further reports I will divulgate them.

73

Gian

Ross, NS7F wrote:
> I would like to build some tube transmitters and am curious where other people get their chassis?

That "Novice Special" is a good article. Reminds me of my first transmitter, a 6C4 driving a 2E26. Got me a special, commemorative QSL from the FCC. Apparently, I was 599 on 7446!

You are in luck! LMB is still around and still makes that very cabinet:
   http://www.lmbheeger.com/products.asp?catid=18

I also like Mouser. Order something from them and you'll get catalogs for a long time. Lots of parts..
   http://www.mouser.com/

Also, MPJA has interesting items from time to time.

Yeppers!!!   I surely do remember the PRM-10. Almost bought one at a hamfest a few years ago, but it looked like it had been through just about every battle in WWII, Vietnam and Desert Storm.

They were good instruments; I used them while I was in the Navy as an ET during the 60s. I found them to be quite useful while overhauling old comm equipment while I was aboard the USS Vulcan (AR-5) during that period. Got a tremendous amount of experience on that ship.

Cheers!!!!

If you've been around electronics a while, you might remember the "SeeZak" line of modular chassis sides and tops. LMB-Heeger carries that same thing now: www.lmbheeger.com

Click on "OmniChassis" on their Products link page.

Chassis sides (sold in pairs) come in 2", 3", or 4" height with lengths from [height] to 17" in increments of one inch. The material is aluminum, 0.040" think. Chassis tops and bottoms come in all dimensions from 4" x 4" to 17" x 17". Top/bottoms are fastened to side pieces with small sheet metal screws (holes provided) at one-inch increments. Side piece ends snap together, final fastening by the screws through top/bottom panels to the bent-over edges of side pieces.

Top/bottom panels thicknesses are 0.040", 0.050", or 0.063" depending on their overall dimensions (13" x 13" and bigger are 0.063" thick). One can use the smaller-length side pieces to form in-chassis walls for shielding or extra mechanical support. An advantage in hole drilling of tops/bottoms is that panels can be mounted on scrap plywood for support (such as in drill press) or punched via industrial punch presses (hard to find those presses now).

Not cheap but they don't cost an arm and a leg either. Another advantage is that making a mistake on hole locations isn't a scrap-out of a whole chassis or klugey retrofit...just use another panel or side piece. While the aluminum alloy is "softer" than 2024, an assembly is as robust mechanically as any fully-formed chassis bought as a unit. I find them very useful in making near-production quality prototypes since they turn out as neat as any full-chassis version.

Yes, buy or build a small sheet metal brake, or use one at a air
conditioning place or airport.

Hi Tim,

> My local sources charge about $5 per sq ft for 0.040" 5052-H14
> aluminum.
>
> A 17x10x3 chassis needs about 3 square feet.

Bobs around between $2.75 and $3.15 CAD where I live in a trucking/farming
community. No shortage of full-sheet capable aluminium shops. Got 5 within
a 20 minute drive.

> That's $15 for materials, not counting wastage because the local
> source only sells it in 4x8 feet sheets :-). I compare that to $25 for
> a Hammond chassis of the same size already made and spot welded, and I
> don't see as big (5:1 or 7:1) of a disparity in prices as you do.

$25 for a 17x10x3 Hammond? You must be in the US. They are $45 here.

So, from my POV, buying retail chassis is just silly.

Cheers,

Gregg

Ahah! The great land of ALCAN.

> $25 for a 17x10x3 Hammond? You must be in the US. They are $45 here.

Strange thing is, Hammond is a Canadian company! I lived in Canada for
two years myself and could not explain the economics either.

Tim.

Well, Ross.
The dates of the articles are about the time I got my novice license. Back then we could go to a sheet metal shop and tell them the size of the chassis (box to them!) and they would cut it and fold it and spot weld it. This was using galvanized sheet steel. I supposed aluminum sheet was available, but cost more. I am sure you could go to a similar sheet metal shop or heating/cooling shop and have them make a box for you.

Another possibility is to watch Ebay for something that will work for you. Although that might take a while.

Good luck.
Paul, KD7HB

I've been thinking of getting some roller inductors to play with next time I visit a hamfest, and it occurred to me that a generic roller inductor doesn't have a linear change in inductance with roller position... does it? E.g., at the half-way point you should get 1/4 the total inductance, right?

Or is the form wound such that the turns are closer together at one end than nothing, thereby linearizing the inductace vs. roller position to some degree?

Thanks,
---Joel Kolstad

P.S. -- They never made small (say, size of an old Kodak film canister)-sized roller inductors meant for QRP work, did they? Most seem to be sized for hundreds if not thousands of watts.

Hi Tim,

> Strange thing is, Hammond is a Canadian company! I lived in Canada for
> two years myself and could not explain the economics either.
>
> Tim.

Our economics are like our politics - inexplicably stupid *rolls eyes*

It's cheaper for me to buy and import Hammond from Parts Express than it is to buy from a dealer an hour away. Dumbfounds me too.

What IS a super deal are Chinese made rack mount cabs w/panel from RP Electronics in Burnaby, BC.... thicker aluminium than the Hammond and $57 compared to ~$180 for the Hammond. I kicked one around (literally), quality is comparable.

Cheers!

Gregg

Right, unless it's wound linear inductance. Those can be found as surplus
from test equipment. The ones found surplus in receiver's are usually
linear frequency, rather than linear inductance. They are visibly quite
different.

> P.S. -- They never made small (say, size of an old Kodak film

They exist. I could barely give a dual one away on Ebay last year. Dual
QRP roller too! Finally someone grabbed it for $5.

Cheers,

Gregg

Hi There,

The Bishop Druit College Radio Club
http://www.qsl.net/mm0axl/mncarg/bdc.html
situated at Coffs Harbour NSW Australia
is hoping to make IRLP contacts on Fridays
0315 - 0345 UTC. (Lunchbreak)

Perhaps areas with similar time zones in Asia,
like Malaysia, Hongkong, Vietnam, China,
Japan, Korea, and parts of Russia are of
interest to the students.

Contacts will be on IRLP node 6625.

Contacts with similar school electronic/radio
groups are of special interest.

If interested please email:
Gary VK2ZKT gryan@bdc.nsw.edu.au
or
Peter VK2EVB vk2evb@wia.org.au

>doesn't have a linear change in inductance with roller position... does it?
>E.g., at the half-way point you should get 1/4 the total inductance, right?

With a roller inductor the ratio of length to diameter is not constant as the tapping point changes so the inductance is not simply proportional to N^2. Using the standard handbook formula (Nagaoka's), I get the inductance at the centre to be just under half (44%) of that across the whole coil. Doubtless though, toward the end, this formula becomes rather inaccurate.

Cheers - Joe G3LLV

In general, a linearly-wound inductor will follow the cylindrical
inductor equations. There might be some changes from that
from the influence of the "left-over" (unconnected) windings,
including fringing capacitance to ground.

In the few cases of linear-frequency-tuning, notably in Collins PTO units and the "rack" assemblies in the R-390 family, the windings were deliberately spaced to handle the powdered-iron core position effect on inductance. I suspect that Collins did a lot of cut-and-try to achieve the correct spacing changes on those; very little quantitative information on it is available in text or on the web. :-)

73, Len AF6AY

I'm not sure I understand the difference. I'd think you'd want a chirp to be phase-continuous, because that means that the waveform doesn't experience any abrupt discontinuities as its frequency is modified. What exactly does "phase coherence" refer to (if not the ability to maintain a fixed phase relationship between two or more different sources)?

Subject says it all.. has anyone created a PCB footprint in EAGLE for the Mini-Circuits GALI MMICs or any other parts that use the same package style? This is the DF782 case style (http://www.minicircuits.com/case_styles/DF782.pdf), PCB layout http://www.minicircuits.com/pcb/98-pl019.pdf .

If someone is willing to share a library file that includes this footprint, I'd appreciate a copy. The minicircuits.lbr file at www.cadsoft.de doesn't include it.

Tnx! -- john, KE5FX

VHF DX seems hot. I've been logging FM broadcast stations from Michigan
down to Missouri from near Vancouver, BC off and on since February!

Cheers,

Gregg

Note that the RF section slugs do not follow a linear-with-frequency position; the while the shafts move linearly with frequency, the cams introduce a necessary nonlinearity in the slug's linear position that is necessary in the overall design.

And to get back to the OP's case of antenna tuners/pi matching networks etc. it is not necessarily desirable to have the tuner's (or pi-network's) inductances and capacitances vary linearly with knob position. You actually want the curve of knob position vs value to be logarithmic (look at the Hammarlund and Millen and National ads from the 40's through the 60's to see all the various nonlinear variable capacitor curves that are desirable in various uses) to make tuning less critical on the high bands and more useful on the low bands.

Folks who grew up with pocket calculators and digital multimeters might assume that everything should be linear. Those of us who learned with slide rules know that in the real world, logarithmic is more useful!

Tim.

I was referring specifically to the "PTO" (Permeability Tuned
Oscillator) that first saw wide use in Collins radios. That
tuning *IS* linear in frequency versus knob position. If you've
ever opened one to examine it, you will understand. Most of
the Collins PTOs also had a minor correction mechanism for
that tuning but, in essence, the winding pitch of the tuning
inductor varied according to some internal Collins manufacturing
rule.

I've also had my hands on many an R-391 and understand that
mighty mechanical monster still - even though it was four decades
ago - and would say that trying to find a correct winding pitch for
all those (broadband relative to tuning rate) inductors would have
made the production cost way too high. It wouldn't be
important because the actual Q of those variable inductors made
the front-end resonators broad enough so that "crude" cam
adjustments were okay for practical purposes.

I began actually handling of lots of high-power HF transmitters in the early 1950s, notably the ones made by the Lewyt Vacuum Cleaner Company! :-)   No real relationship of capacitance or inductance curves to tuning...wayyyy too many variables involved in antennas-lines-etc. to pin down any "necessary curves."

> Folks who grew up with pocket calculators and digital multimeters

High disagreement there. Having learned and owned a slide rule in high school of the late 1940s (and understood logs and elementary transcendentals), I switched to sceientific calculators (forever, I think) as soon as they were on the market, never looked back. I severely dislike non-linear tuning as it has NO physical-sensor-body correlation with signal bandwidths or carrier positions.

I see Joel's roller inductor question connected with my experience with Press-Wireless 15 KW transmitters and their dual copper tubing final amplifier inductors. QSYs on those PW-15s required unwrenching the shorting links then rearranging the shorting links, remounting them, again with a wrench. Having helped make better sets of shorting links and doing some intial tuning (to set preset tables for number of links), the unshorted links were generally in the inductance values predictable by old-style equations of inductors. There was some effect of the shorted turns which was arrived at during the preset tune-up tests. Those were feeding rhombics directly and there were no fancy tuning-matching circuits involved in the typical 4 to 18 MHz RF region.

An automatic tuner I worked on a long time ago had motor-driven variable inductors only slightly larger than that. I guess it handled about 200 watts. The design wasn't roller, but slider; it tuned very fast for a mechanical system. There were one or two motor-driven vacuum variables in there too.

Cheers,
Tom

THIS REALLY CAN MAKE YOU EASY MONEY! IT WORKS!
BUT YOU HAVE TO FOLLOW IT CAREFULLY FOR IT TO WORK!
A little while back, I was looking on the web for easy ways to make money and I kept thinking that all of the ways I was reading would never work and were just scams, but not this one! The article that I had found said that I could make thousands of dollars easily in a matter of weeks with only an initial small payment of $6.00. I thought, "Yeah, right, this must be a scam like most of the rest", but like most of us, I was curious, so I kept reading. Anyway, it said that if I sent $1.00 to each of the 6 names and addresses listed at the bottom of the article that I would make great money but only if I followed the following steps. After sending the $1.00 to each person you were then instructed to rewrite the list by taking the 1st person off of the list then moving the 2nd person to the 1st spot, and the 3rd person to the 2nd spot, etc, etc. Finally you should be left with the number 6 spot empty and this is where you place your name and address. After reconfiguring the list you then must post it on about 200 newsgroups (doesn't matter but the more places you post the more money you make!). There are thousands and thousands of newsgroups from around the world so this task is easy and that was it when I was done! No catch. So after thinking it over, I thought about trying it. I figured, what have I got to lose except 6 stamps and $6.00, right? Like most of us I was a little skeptical because it seemed so easy and I was a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! (U.S. Postal and Lottery Laws Title 18, Section 1302 and 1341 and Code of Federal Regulations, Volume 16, Sections 255 and 436) After reviewing the pros and cons of the investment I decided to carry out with it. I invested the measly $6.00 and guess what? Within 7 days, I started getting money in the mail!! I was very shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over $6,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $21,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps. Now let me explain to you how this works and most importantly, why it works. Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it.

STEP 1: Get 6 separate pieces of paper and write the following on
each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6
US
$1.00 bills and place ONE inside EACH of the 6 pieces of paper so the
bill will not be seen through the envelope to prevent thievery.
Next,
place one paper in each of the 6 envelopes and seal them. You should
now have 6 sealed envelopes, each with a piece of paper stating the
above phrase (PLEASE PUT ME ON YOUR MAILING LIST), your name and
address, and a $1.00 bill. What you are doing with this letter is
creating a service. THIS IS ABSOLUTELY LEGAL!
Now mail the 6 envelopes to the following addresses:

1. LORRAINE HUTCHINSON (P.O. BOX 23951 LONDON ENGLAND E12 5YP)
2. GEAN SAPP (1768 OLD HICKORY STREET, DECATUR, GA 30032)
3. TAMEKA HILL (P.O. BOX 188 JAMESVILLE, NC 27846)
4. DAN BELL (1519 CAMERON LANDING DRIVE, STOCKBRIDGE, GA 30281)
5. ERIC PORAT (2345 EAST 64 STREET, BROOKLYN, NY 11234)
6. MATT SANTIAMAGRO (1120 SUNSET AVE, KELLEY, IA 50134)

STEP 2: After you have mailed out your letters creating a service and
making this legal, take the #1 name off the list that you see above,
move the other names up (6 becomes 5, 5 becomes 4, etc...) and add
YOUR NAME & ADDRESS as number 6 on the list.

STEP 3: Change anything you need to in this article, but try to keep
this article as close to original as possible. Now, post your
amended
article to at least 200 newsgroups. (I believe there are close to
24,000 groups in USA alone). All you need is 200, but remember, the
more you post- the more money you make!

DIRECTIONS --HOW TO POST TO NEWSGROUPS

Step a) You do not need to re-type this entire letter to do your own
posting. Simply put your cursor at the beginning of this letter and
drag your cursor to the bottom of this document, and select 'copy'
from the edit menu. This will copy the entire letter into the
computers memory.

Step b) Open a blank "notepad" file under accessories in windows and
place your cursor at the top of the blank page. From the 'edit' menu
select 'paste'. This will paste a copy of the letter into notepad so
that you can add your name to the list.

Step c) Save your new notepad file as a .txt file. If you want to do
your postings in different sittings, you'll always have this file to
go back to.

Step d) Use the Internet to search for various newsgroups (on-line
forums, message boards, chat sites, discussions.)

Step e) Visit these message boards and post this article as a new
message by highlighting the text of this letter and selecting paste
from the edit menu. Fill in the Subject, this will be the header
that
everyone sees as they scroll through the list of postings in a
particular group, click the post message button. After you have
completed these steps you are done with your first posting.
Congratulations! You are that much closer to easy money! THAT'S IT!
All you have to do is jump to different newsgroups and post away,
after you get the hang of it, it will take about 30 seconds for each

newsgroup! That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. *JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT AND REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200*

WHY it works: Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the internet and reading these articles everyday. Remember play FAIRLY and HONESTLY and this will work.

> ---Joel Kolstad
>
> P.S. -- They never made small (say, size of an old Kodak film canister)-sized roller inductors meant for QRP work, did they? Most seem to be sized for hundreds if not thousands of watts.
>

Interesting puzzler and as I've a number of these Roller Coasters built in to various old military radios, I measured one.
This particular inductor is the "Aerial Tuning" inductor fitted inside the casing of a 1946 vintage, UK "Wireless set number 62", a TR-RX running about 2 to 8MHz. The inductor is a Paxolin former 6.5" long by 2" diameter, wound with what looks like 1mm dia' Silver wire. There's exactly 100 turns wound evenly along it's length and the radio front panel has a little window showing a "00" to "99" turns counter, operated by the tuning knob and a neat Geneva mechanism. For measurement purposes, it's ideal.

TURNS.	INDUCTANCE.
100	132uH
90	120uH
80	103uH
70	89uH
60	73uH
50	58uH
40	43uH
30	29uH
20	15.8uH
10	4.7uH
0	0.12uH

Values look not too non-linear and probably follow the solenoid formulas but I can't be arsed doing the calcs :).

```

Using Mathcad, the coil mentioned in this thread has the following properties:

1) From 0 to 20 turns the inductance is 0.038 times n squared microhrenies (square law).

2) From 20 to 100 turns the inductance is (1.49 n - 16) microhenries (very linear).

For the first 20 turns the coil has the square law property because all of the turns are tightly coupled to each other. This is not the case for the other 80 turns of a long solenoid.

A PDF of the Mathcad calculation and graph are available by email from W0IYH at QRZ.COM).

```

Nowadays two-way radios are getting more and more powerful, coverage up to 8, 10 12 or more miles. Ironically, it is even harder to buy one with only 2-mile distance.

I want to use a two radio just for short distance, for example, only within 1000 feet. How to modify the circuit (generally speaking) so I can extend the radio's powerful consumption? As I do not need it to communicate for longer distance, I want it to reduce power output, so I can use it for longer time. I know it is difficult to illustrate

without a schematics, but just in general terms, what kind of options
or in what areas can I do the modification?

One of my applications is to use 2-way radio as baby monitor for
longer distance than normal baby monitor does.

The simplest modification is an attenuator pad between In/Out and the antenna. If you have a "one-piece" FRS HT such as the little Motorola my wife and I use at home, it is difficult to wedge one in there. An alternative in that case is to use a piece of conducting foam (typically for storage of CMOS digital devices) to sit over the antenna stub. One has to experiment with the size of the block of plastic foam.

A drawback to using an HT is the power drain on the internal battery and forcing the PTT button into transmit all the time. That will eat up battery charges and an external power source would be needed. However, always on transmit can cause interference to other users on that FRS channel and is a legal no-no. It would be better to just get an old 49 MHz baby monitor and use that directly.

I am trying to modify a 1 tube amp for 6 meters using a 6146. I think the amp was origionally used for CB though it does tune up on 10 meters. It worked OK before I removed the input circuit and put in one for 6M. The problem is I cant neutralize the damn thing. It makes a great osc.I was thinking of scraping the tuned input and replacing it with a 200 ohm resistor and a 4:1UNUN. I figure this low of an impedance on the grid would swamp out any feedback that might me causing it to osc. I have about 5 watts PEP of drive.

Jimmie

It could be the screen bypassing--it is critical.

If you can find an old VHF ARRL Handbook
from the sixties you might find some ideas, tips and tricks regarding using
these tubes on VHF. Another problem is unwanted inductive feedback, such
as when the ground ring lugs on some style sockets were used for the

bypass caps... Those rings had enough inductance at VHF to cause unwanted coupling... Can you neutralize the tube using the conventional neutralizing stub method??

I think his point is that he's trying to reduce transmitter output power to conserve battery life - of course, an attenuator pad isn't going to accomplish that.

Probably the "easiest" way to accomplish this would be to bypass the final amplifier stage, passing its drive signal directly to the final filter, and from there to the antenna. I would suggest this would be nearly impossible to accomplish without a schematic - and not particularly easy even with it.

I wonder if the best route would be to use a regular baby monitor transmitter - but use a better receiver and/or receiving antenna? Like a decent scanner, possibly with an attic antenna. This method is easy to accomplish even for someone without electronics experience, and unquestionably legal, unlike many other alternatives.

================================
Assuming that you talk about licence free handheld radios eg FRS in the
USA   or PMR446 in Europe ,500 milli Watt  with a fixed  (rubber duck)
antenna , you can locate the radio (partly) inside a plastic or carton
cylinder which is covered with baking foil (also at one end)

The more the antenna is surrounded by the cylinder ,hence baking foil ,
the weaker the radiated signal . You then can adjust the cylinder such
that a acceptable signal is received at the other location.

Locate the trace that feeds switched battery voltage to the final transmitting stage. Cut this trace somewhere between the transmit switching circuit and the final amp stage. Insert a few rectifier-type diodes (1N400x) in series across the cut point. Each diode in series will lower the voltage to the final amp stage about .7V or so. For each halving of voltage to the final stage, the output power (and consequently the power load on the battery) will drop by 4:1. All of this assumes that the final amplifier is well-behaved under reduced voltage conditions, which should be true but is not guaranteed.

A lot of the time both the final and the driver are fed from the same source
so just one diode may have a considerable effect.

Hi all,

It's marked D3827G002 in a 16 pin SOIC and is used in an AMPS RX chain

Pins identified so far:

PIN 1	Ref / 64 (?)
PIN 2	Ref / 64 (?)
PIN 3	Clock, Data or Strobe
PIN 4	Clock, Data or Strobe
PIN 5	Clock, Data or Strobe
PIN 6	5V
PIN 7	REF IN (15.36MHz)
PIN 8	
PIN 9	
PIN 10	
PIN 11	
PIN 12	
PIN 13	GND
PIN 14	From Prescaler (?)
PIN 15	Modulus Select out (?)
PIN 16	

Date code is around 1990.

Any pointers to a data sheet or a programming guide will be most
welcome.

Thanks,

Mark.

The VHF Hanbook from the 1960's used a 6252 -- I believe that this was also
the bube used in various transverters sold by Hallicrafters --- my but no
6146 design -- I still have a bunch of 6360's hanging around from that era.

There is a 6146 transverter design in the 1973 ARRL Handbook --
comprehensive enough to get you done.

It might help to give us some more information (see below):

On Sat, 12 May 2007, Jimmie D wrote:

> I am trying to modify a 1 tube amp for 6 meters using a 6146. I think the amp was origionally used for CB though it does tune up on 10 meters. It worked OK before I removed the input circuit and put in one for 6M.

A key question I would ask at this point is whether the amp, used originally for CB (27 mHz), was, itself neutralized? Some ham transmitters were not neutralized (eg. Heathkit, Ranger) although they were operated up to 10 meters.

The

> problem is I cant neutralize the damn thing.

When you removed the original input circuit, what, exactly, did you replace it with?

I have found that neutralization of grounded-cathode amplifiers (i.e. high gain) can be a major pain.

It makes a great osc.I was

> thinking of scraping the tuned input and replacing it with a 200 ohm resistor and a 4:1UNUN. I figure this low of an impedance on the grid would swamp out any feedback that might me causing it to osc.

Nah, I gonna bet that ain't gonna work.

I have about 5 watts

> PEP of drive.

FWIW:
My approach to this would be to build something grounded-grid and that means any grid tube where you can get all the grids to (real) ground. You _might_ get 6AG7s or 6CL6s (two might be enough) in parallel and any decent input matching network might do the job for you and get about one "S-unit" of power gain. Tube efficiency will be a little lower at 50 mHz than 27-28 mhz but not that much.

One of the guys said that screen grid bypassing is critical and I can attest to that, too. Some of the published material even gives separate neutralization circuits for just the screen grid circuit. Very big pain in the neck if you have to do this by trial and error.

Good luck!

This comming Sunday...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday May 20th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which offers a 30% discount. By prepaying you get a discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered well illuminated tailgate area is available for all sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

<<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2007 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space
$15 Additional Spaces
Admission is after the prepaid vendors

```
Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
                ** You may not sell. **
                $15 per person at the gate.

Nowadays, most keyers are nothing more than a micrcontroller, usually a PIC, a battery, a couple of jacks, and some sort of interface, usually a pushbutton. There must be a hundred designs out there, but they all boil down to the same thing. It used to be that the PIC was relatively expensive ($6 or $7) but nowadays, a PIC with more than enough juice for non-memory keyer is $1.01 at Newark. For a memory keyer, you might have to get close to $2. Still way less than the shipping.

A quick google reveals
http://www.qsl.net/dl4yhf/pic_key.html
http://www.qrpis.org/~k3ng/pic/pic_keyer_2.html
http://www.vk1od.net/pik/pik.htm

Far Circuits has a PC board, K1EL sells programmed chips. Google is your friend!

..

Unless the OP intends to use it for covert evesdropping, hence the plan to make the battery last longer. 1000 feet is a long way for a baby monitor to be needed that would be on the next block in most cities.

Asking in an amatuer radio newsgroup (where the goal is often increasing the range not decreasing it) might not be the best source of info.
thanks, John.

Is there any obvious choice in 6BY6 vs 6BE6 in a product detector?

I've subbed one for the other in replacement uses and there wasn't any hugely obvious differences, but maybe if someone told me what to look for... :-)

============================
Power amplifiers in the past had untuned input circuits (see above)
because the driving transmitter (with valves in the output stage) had an
adjustable 'Pi-tank' for matching.
However nowadays most driving transmitters (usually transceivers) have a
solid state output stage requiring a resistive load of near 50 Ohms .
So when using these for driving a valve power amp ENSURE the amp has a
tuned input circuit . If not ,a matching circuit will have to be added.
Alternatively the valve power amp can be modified with a simple passive
input circuit comprising an 1:4 impedance transformer and a 200 ohms
non-inductive resistor capable of absorbing the driving power .

I looked through the QST indices and did not see any sign of an 811A being used on 6M in a construction article. Doesn't mean it couldn't be done. There was an article in the Jan '69 QST about modifying the SB-200 (two 572B's) for 6M that might have worked! The 572B would have similar parasitics to an 811A but might be a little less fussy... but two tubes would be harder than one (paralleled capacitance) to get to load up.

Tim.

hmmm number 1 rule...make sure you're not chasing problems faced by poor test equipment!

Well got rid of the scope probe and used a direct connection with some 50R coax, suddenly I can see the actual oscillator waveform (was completely killed by all 10 sets of probes I pulled out of the box, some are 100Mhz rated). So I now know when its oscillating or not. Also, the 200 odd MHz reading on the frequency meter was caused by an impedance mismatch doubling the frequency. With 50R input on the frequency counter and a suitable output resistor on my oscillator buffer amp I get the correct frequency.

Also I'd made a silly mistake which was throwing me (causing no low mixer output)...I connected a 455kHz IF can filter can across the output of the 612, but the impedance was too low, so it was just hammering the output. With a suitable 1.5kR ceramic filter I can see tuned carriers. (My excuse is that I was suckered into it by having used a similar tuned can on the input of the 612 in the past!)

So...a bit of progress. Still looking out for a good HP spec with 300Hz res band option!   Everytime I see a skip I look in hopefully....

Thanks to everyone who provided their thoughts on this...its helped a lot

Also worth noting:

The solid state rigs really like to see the Fly Wheel provided
by even a low Q circuit on the input; a class B amp. will
otherwise see an unsymmetrical load over portions of
each cycle for the driving signal .

rec.radio.amateur.antenna:40756

I am trying to construct a broadband 4:1 balun, and I want to double check if my understanding of the measurements is correct before I apply any real RF power.

I do not have access to an antenna analyzer, though I do have an HP4193A Vector Impedance meter and HP8753 Network Analyzer at my disposal.

First I wound the core in a bifilar manner with the leads being labeled A1,B1 and A2,B2. Then I measured the input impedance across A1 and A2 leaving B1 and B2 unconnected. Then placed a 200 ohm resistor across A1 and B2 while tying B1 and A2 together, and measured across A1 and A2 looking for 50 ohms (4:1).

I have also seen a reference to a K value for an indication of broadbandness. K = 1 - L(short)/L(open)

Here are my results...

8 bifilar turns of teflon coated AWG 16, on Type 43 core.

```
Mhz     A1-A2 Open Impedance      A1-A2  200 ohm Impedance
2         941 @ +59.5               51.4 @ 3.6  (51.3 +3.2j)
4        2080 @ -25.6               51.7 @ 3.2
7        4130 @ -74.2               52.1 @ 3.7
10       2900 @ -81.5               52.3 @ 4.4
14       1687 @ -84.8               52.4 @ 5.6
18       1180 @ -86.1               52.5 @ 6.8
21        966 @ -86.7               52.6 @ 7.7
25        781 @ -87.2               52.7 @ 9.1
28        682 @ -87.3               52.6 @ 10.2
30        630 @ -87.5               52.7 @ 10.8 (51.7 +9.9j)
-------------------------------------------------------------
50        356 @ -87.0               52.8 @ 18.6
54        327 @ -86.2               52.8 @ 20.4  (49.5 +18j)
```

Inductance Open = .93 uH
Inductance Short = 167 uH
K == .994

I did not intend to operate this balun above 10m, but thought it would be interesting to see the 6m data as well. And it looks like it would work fine there as well.

From what I have read, the open reactance should be at least 4 to 5 times as high as the normal drive impedence. In this case, it is over 12 times the 50 ohm input at 30Mhz and over 6 times at 54Mhz.

So did I do good? Am I way off?
How can I tell if/when core saturation will be a problem?

Hi Teh,

Your numbers suggest Type 75 instead, OR some other mechanism at work. Given your lead description above is fine, but could have been poorly implemented (in text, it is difficult to sort those things out).

The ratio is as good as any. More important is how much power the BalUn can withstand. Your last question gets into the common misconception of "core saturation" which is typically a consideration for the winding linked magnetics not found in this application. BalUns are not classical power transformers that are so common to 60Hz AC.

The choke BalUn (which is what you are building) employs the lossy resistance of Ferrite to establish the isolation you want in a BalUn. There may be some reactance achieved along the way, but it is not usually a design goal and these class of Ferrites would be a poor choice in achieving that. If you note that your data describes a very, very broad curve; it demonstrates a very poor Q which is its principle attraction (broadbandedness).

As a simple test, pass one very short wire through one bead and measure its Z (give us a complete description of resistance AND reactance) over frequency. This will confirm what type material you are using and will remove unnecessary complexity. Type 43 should show a frequency peak roughly ten times above your current data's frequency peak.

This may have been obscure. The peak of isolation (as revealed in
common mode resistance) should occur in the low VHF region, not the
low HF.

Hi all,

I like to inform you that Martein Bakker, PA3AKE, has updated his web page reporting his measurement on the H-Mode Mixer. The update is relative to measurement done on the I7SWX 2T H-Mode Mixer using the FSA3157 and the original 2T version with Pericom PI5C3125 fast bus switch.

A major comment reported by Martein on the 2T HMM version with FSA3157 is:

"2 transformer version is an interesting branch in H-Mode mixer development. Most impressive is the spur reduction possible with home made transformers with this configuration in combination with the FSA3157 switches."

PA3AKE web page is: http://www.xs4all.nl/~martein/pa3ake/hmode/

Below is reported the Contents list of all measurements done and comments reported by Martein. I am sure all those that have visited and will visit his page will find one of the most complete reports done on the important H-Mode Mixer developed by Colin Horrabine, G3SBI.

73 and enjoy the reading

Anybody happen to have the details of the dipper coils for the MFJ-259B Antenna Analyzer? Mine have become lost in a garage/workshop cleanout that went awry.

Need number of turns, coil diameter, coil length if possible. Think I can remember the rest of the details well enough to rebuild them.

Thanks for your help

William E. Sabin wrote:

> "Computer Grade Capacitor" might possibly refer to the low value of internal series resistance and inductance which are important parameters in switching regulator power supplies.

Well, maybe "low inductance" by 1960's standards. A computer power supply would have to filter 60Hz, or maybe 400Hz ripple then. Yes, there were switching supplies back in the 60's/70's too, but then switching frequencies were much much lower (think about it: they used 2N3055's or their predecessors, transistors that take a millenium to turn off!) than typical switching supplies today.

Modern low-ESR low-inductance caps are undoubtedly superior if you're designing 150kHz switching supplies today. Heck, many of the modern regulator chips will only be stable if they are operated into capacitors that have an ESR above a minimum and below a maximum number. There's a reason why there are 87 different 220uF 6.3V capacitors in the Digikey catalog :-).

Clearly for their purposes, surplus 2N3055's and old big-can "computer grade capacitors" can be put to very good use in many ham power supplies. Make sure you get some LM723's too, a very versatile part that modern parts (each good in their own narrow niche) have not completely replaced yet!

(I did lament here on Usenet when the CA3046 was discontinued a year or two ago... a shame! But the LM723 will outlive it!)

Tim.

As you have a vector impedance meter have you measured the common mode
(blocking) impedance? From the description your balun is a voltage
balun that are notorious for having poor common mode impedances.

Apart from aviation, the last time the last time I heard someone using
400 Hz for powering computers was in the early 1960's with a 50/400 Hz
motor/generator in the basement, feeding the anode supply of some tube
computers :-), in order to reduce the transformer and filter capacity
size.

>Yes,
>there were switching supplies back in the 60's/70's too, but then
>switching frequencies were much much lower (think about it: they used
>2N3055's or their predecessors, transistors that take a millenium to

Outside TV EHT generators, primary switching power supplies were rare
in those days, simply because bipolars could not handle the rectified
mains voltage in those days, not at least with any significant
current, so linear power supplies was the norm in those days.

>Clearly for their purposes, surplus 2N3055's and old big-can "computer
>grade capacitors" can be put to very good use in many ham power
>supplies. Make sure you get some LM723's too, a very versatile part
>that modern parts (each good in their own narrow niche) have not
>completely replaced yet!

My guess is that amateur radio is the last application in which linear
power supplies are used, since it is much easier to make a low noise
linear power supply than a switcher.

Yes, the balun is a 4:1 voltage type. I have not measured the common
mode inductance yet. But in this case, the application is for a Carolina
Windom which requires common mode current to make part of the feedline
act as a radiator.

The feedline will be choked with a 1:1 current balun at the proper
distance. That is next on the list to be built.

Okay, then in that case be sure to check the common mode impedance on
your current balun. Many are less than 1K and, for good operation
you'll need more than that. The higher the better.

I did find out that part of my test setup was flawed.
My adapter from the VIM probe to the coil did very naughty things.
The new setup completely isolates the balun from any surrounding
influences and stray L/C is minimized.

Testing the bead material properties.
The beads I am using are supposed to be Type 43, DigiKey #240-2119-ND
aka Steward 28B1250-000. They are .875" high, 1.25" OD and .75" ID.

Using piece of wire 3" long bent into a U shape. Measurements are
Magnitude and Angle of the vector.

```
Freq.
(MHz)        Bare Wire         Single Bead         Two Beads
```

.5	.58 @ 29.0	4.62 @ 68.2	9.0 @ 70.3
1	.74 @ 46.0	8.09 @ 70.2	15.8 @ 71.0
2	1.15 @ 62.1	14.36 @ 70.2	28.0 @ 70.4
4	2.08 @ 74.7	25.30 @ 67.0	49.6 @ 66.3
8	4.04 @ 81.8	42.00 @ 61.6	81.7 @ 60.3
16	8.01 @ 85.5	68.50 @ 56.4	132.7 @ 54.0
32	15.93 @ 87.3	105.40 @ 46.9	204.0 @ 42.3
64	31.80 @ 88.4	145.10 @ 37.4	279.0 @ 27.9
110	56.30 @ 89.0	181.00 @ 30.6	333.0 @ 13.2

Remeasuring the Balun.
With the new setup, there is not a big difference in the terminated measurements, but the peak in the open impedance of the primary winding went from ~7 Mhz up to 11.4 Mhz.

Freq. (MHz)	Open Inductance	200 Ohm Termination
.5	275 @ 74	49.6 @ 9.2

Large electrolytics labeled "computer grade" were quite common in low-voltage supplies required for digital electronics from the early 1960s and into the next three decades. Once the TTL family of digital ICs "took off" all digital electronics seemed to require 5 VDC supplies. :-)

Since the early TTLs were - relatively speaking - power-hungry, the supply current had to be much higher than for old tube architecture equipment. With that was the requirement for filtering the raw DC from (nearly-always) full-wave rectification resulting in 120 Hz ripple.
The end result was a market need for higher-Farad electrolytics.
Low-ESR in those large-capacity electrolytics was, in my opinion, less of a problem for switchers than it was to cut down on the internal heat dissipated by the ripple current in that ESR.

>>Yes,

I agree with that, Paul. The switch-mode supplies did not increase in either market quantity or acceptance in OEM equipment until the late 1970s. One frequently-overlooked example is the small supply (a switcher) used in the Apple][personal computer. Well over a quarter million made and sold to power a small computer using (then) legacy TTL devices. While some CP/M-based PCs existed using switching supplies, other PC makers saw the advantage and started using switchers also, even the "IBM" that became the norm for PCs after 1980. While most switching supplies were still radiating RFI into the late 1990s, that did not trouble PCs operation. After multi-millions of PCs have been made with switchers for power supplies in over two decades, it would seem (to many) that "switchers have always been used." :-)

>>Clearly for their purposes, surplus 2N3055's and old big-can "computer
>>grade capacitors" can be put to very good use in many ham power
>>supplies. Make sure you get some LM723's too, a very versatile part
>>that modern parts (each good in their own narrow niche) have not
>>completely replaced yet!
>
>My guess is that amateur radio is the last application in which linear
>power supplies are used, since it is much easier to make a low noise
>linear power supply than a switcher.

Much SIMPLER. :-) Today a typical under-1-Ampere supply consists of an AC transformer, bridge rectifier, one filter capacitor, and one three-terminal regulator. Positive or negative polarity, no real change in components. Guaranteed voltage regulation and the legacy three-terminal regulator ("7805" for +5 VDC output) has over-current shut-down. Spec sheets on three-terminal regulators include maximum internal noise generation (very low) which few bother to notice. :-)

Excess power dissipation in a linear regulator? Actually not much. A typical +5 VDC supply for 0.5 A uses a typical 8.5 V average raw DC input and a three-terminal regulator drops about 3.5 V average for a 1.75 W average loss converted to heat. The TO-220 cases of three-terminal regulators are built to handle that (and a bit more) if mounted to a "heat sink" of copper-one-side PCB. Three-terminal regulators are entering their fourth decade of existance and couldn't be more convenient to use for a defined, regulated output voltage.

73, Len AF6AY

Teh,

After reading you previous response as the your application I have

some real doubts as to the efficiency and power handling capability of
you unit.

I suggest you may find some very useful information at:

http://audiosystemsgroup.com/RFI-Ham.pdf

The section on baluns begins on page 24, however, my power concern is
addressed on page 26.

I think you find that information valuable.

73,
Danny, K6MHE

MG Sets (400 Hz) powered many mainframe and midrange systems well through the late 1970s; CDC's small graphics system called 'GRID' used a mini (2500KVA) 400 Hz MG set and it was built with TTL and DTL, and the entire 1604, 3000, 6000, 7000 and most Cybers used large MG sets. The 160/160A/8090 series could be equipped with 400 Hz (MG driven) supplies or 60 Hz switchers (circa 1959-1966).

Regards,

Michael

sci.electronics.repair:65852

Greetings:

I just acquired a Tek 7603 scope with 7A18 dual-trace vert. and 7B53A timebase plugins but upon internal inspection and cleaning discovered that the readout board (when facing the front of the instrument it is found on the upper right side midway along the length) is missing, as are all interconnecting cables it uses.

The display is very corrupted: odd blanking and sawtooth displays appear with no vertical input and horizontal sweep width changes with timebase selection in a drastic way. A vertical input signal modulates the strange displays in a fashion that suggests the vertical section is functional and the vertical position controls do work.

The plugins are supposed to be in operating condition.

The internal logic timeshares the display between readout and waveforms and is rather complex and implemented in Tek custom hybrid ICs and a mix of TTL and CMOS. I would really appreciate a report of the behavior on a working 7600 series scope when the readout board is disconnected; the service manual describes various voltage measurements with the board removed so it is permissible to do so and power the instrument (but no mention is made of the scope's behavior with the board removed).

Many thanks to anyone willing to do this.

Regards,

Michael

```

Hi,

I've been recently going through a similar process. Designing a UHF VCO for a hobby project, mainly as a self-education project. As in, rather than buying the thing from Minicircuits or whoever and be done, learn how to design and build one myself, so that I never have to buy them. And to get them much cheaper... a few cents a piece, as long as you don't mind the effort.

Anyway, when I couldn't get it quite right for a while, with tuning range, harmonics, output power, etc, here's what I did: Build a prototype, measure the frequency and output level. Try with a few different tuning cap values in place where the varicap would be. Got a proper RF simulation software*. Spice is probably not the best tool for that. See if simulated oscillator frequencies match what was really measured. I found out that after I included all parasitics properly (eg. 0805 capacitor might have about 2nH inductance), and also the PCB interconnections and the right transistor model, I get almost exact match. A 1.4GHz frequency in the simulation, within a few % off the real measured frequency. So now I know I got the simulation right, and I can go ahead and experiment with different varicap types, circuit topologies, etc... and I only get to the next PCB+soldering iron exersize when the simulated performance is what I need. Saves time.

* I realise that getting 'proper' RF simulation software can be tricky/ expensive...

-- Cheers,
3flp

What coils?

My MFJ-259B has all the guts inside!!!

rec.radio.amateur.homebrew:13192

For many years I worked for other people on the daily grind. 9 - 5 and much
longer
hours for what now seems like very poor pay.
I suppose looking back on it now, I didn't really know how trapped I
was until I discovered an easy way to make money using Ebay and the
Internet.
Since then I haven't looked back and have been making money
consistently. For a long time now, I have been developing a number of
interesting methods that can realize lots of money both on and off
ebay. I am now offering you the opportunity to do the same.
Each method is completely legal. There are no pyramid schemes, MLM
schemes, affiliate programs, investment schemes or adults only
business. This is not dropshipping, misspelled ebay adverts or
selling
for other people.
I am offering you the chance to make enormous amounts of money both
on
and off ebay!
Are you tired of 'Get Rich Schemes'? Well you can relax and purchase
from someone with an excellent reputation.
I have been making a living online now for many years and have a
number of different ebay ID's from which I sell. I do a lot of
different things both on and off ebay and make a profit from all of
them. I have found enormous success in four key areas that I am now
offering to you.
These methods are not diet pills, pyramid schemes, affiliate
marketing, or running a website, just four incredible opportunities
for you to make enormous amounts of money.
'I don't just sell these methods, I guarantee them. And if you don't
succeed then I'll give you double your money back!'
WHAT I OFFER
Four great systems for generating fast cash

Post what options were sold as part of this scope. Some were sold without readouts, the fact there are no connectors indicates that possibly the readout option was deleted.

IMHO, (and this is just a WAG) the problem you are reporting is not related to the readout...

Digging through Internet archives this morning I noticed a few posts
from folks seeking the readout board for 760x scopes with a mention

that 'Option 01' was a cost-reduced version sans this board so evidently the scope should work without it (if properly optioned?). I was not sure if any cable modifications would be needed if the board were removed from a scope not-so-optioned.

And indeed I now discover an "Option 1" label on the bottom of the left bay so this scope never had the board.

Its problems are elsewhere.

Thanks,

Michael

<snippety>

There is a Tektronix group on Yahoo groups that is loaded with very experienced 'Tekkies.' You would do well to take your query there.

Off the top of my head, I would say two things.

(1) Get the service manuals for your 'scope frame, AND both plug-ins. It will be nearly impossible to troubleshoot or service without them.

(2) Check your power supply section for bad filter caps, correct voltages, noise, etc. Ironically enough, you will likely need a known-working 'scope to fix this one.

Happy tweaking.

Yep!!! My MFJ-259B has lots of guts too.
The dipper coils are used to make the Analyzer operate like a grid dip meter.
Extremely useful for tuning traps, tanks, etc.   They are an accessory to the
Analyzer; I think the part number for them is MFJ-66.
There are two coils in the set, one for 1.8 MHz to 50 MHz, the other covers 20
MHz to 170 MHz.

Cheers!

Wow! I learned something today. Even old farts can learn something new.

BTW: my grid dipper is a real grid dipper ... AN/PRM-10. Anybody remember that
old boatanchor?

I would like to build some tube transmitters and am curious where
other people get their chassis? Article 1 (The Novice Special, from
the arrl website) calls for LMB SQ-1 cabinet (8.5 x 4.5 x 4.5 in)
which "comes complete with chassis and front panel".
Article 2 (A Three-Band One-Tube Novice Transmitter, from Dec '57 QST)
calls for a 2 x 7 x 13 in aluminum chassis enclosed in a 7 x 9 x 15 in

aluminum box.
Any suggestions?
Thanks and 73,
Ross, NS7F

Aluminum chassis are available ($10-$30 range depending on size) from www.digikey.com, www.mouser.com, www.tubesandmore.com, etc.

Kitchen pans/baking trays can be surprisingly effective as well for a lot less money.

A good hardware/welding store will have aluminum sheet and extrusions. Home Depot etc. really suck in this area.

As far as full metal cabinets go, the above-named distributors will have them by Hammond, Bud, etc., but you'll be shocked at the prices. Recycled enclosures from other projects or picked up at hamfests are quite affordable though.

McMaster-Carr has a lot of stuff, not discount prices, but excellent selection and they ship to me overnight via UPS ground. They also have a lot of plastics, tubes, etc. http://www.mcmaster-carr.com/

Also, consider having enclosures made at a local sheet metal shop (heating, cooling, ventilating); I've had them done for _very_ little money out of galvanized, and you can solder to them.

Regards,

Michael

The problem was a defective C811 (14000 uf / 25v), the -18V filter capacitor for the -15V supply.

Scope works well now.

Regards,

Michael

It is the working grade. Rated duty cycle.
There are commercial - 8 hours in 24
industrial - 12 hours in 24
computer or telephone grade 24 hours in 24.

The MTBF data is determined using the appropriate duty cycle.
See ITT Handbook for more info.

Hello,

The aluminium that retail chassis are made from is a joke. Get some
1.6mm 5052-H14 from a local aluminium shop, a $30 brake and away you go.
You can make 5-7 for the cost of one retail ;-)

Cheers,

--
Gregg

Sounds good to my repair eperience. Due to own experience bad/dried filter caps in the LV pwr supply of Tek 76xx is often a problem. I had more than 50 of these for repair, and most of these due to cap problems.

Good luck with your fresh repaired scope, it is a nice instrument (with and without readout option).

hth,
Andreas

Hi There,

The Bishop Druit College Radio Club
http://www.qsl.net/mm0axl/mncarg/bdc.html situated in the Mid North Coast of
NSW

Australia at Coffs Harbour are looking forward to making Local or DX IRLP contacts on Fridays 0315 - 0345 UTC.

Contacts will be on IRLP node 6625 via local repeater VK2RDO on 146.650Mhz.

The young people in the club have been experimenting with building simple FM radio recievers, and have been contemplating the design of plasma balls using ordinary light globes and car spark coils.

Contacts with interested parties or similar school electronic/radio groups would be great but unfortunately the club only has limited time during the local lunchtime period.

Also the Bishop Druit College French and German Language classes are interested in contacts Monday to Friday 0315 - 0345 UTC.

If interested and can help arrange a contact please email:

Gary VK2ZKT gryan@bdc.nsw.edu.au

or

Peter VK2EVB vk2evb@wia.org.au

=======================
Assuming that these dipper coils are connected to a PL259 plug for
connecting to the MFJ259B 's SO239 socket ,  it should not be too
difficult to homebrew the coils .........I'll have a go at that.

Ross,

Commercial outlets like Digi-Key, Mouser, Newark-Inone, and Allied Electronics carry a wide array of aluminum and steel enclosures. They're not cheap these days, but if you need one, you need one. Also keep an eye on eBay for chassis and enclosures. I've snagged some good ones there at very reasonable prices. And, of course, visit every local hamfest and SK estate sale. There are still bargains to be had that way. I picked up a nice cabinet at an estate sale just the other day which I intend to build a power supply in. It is about 6" tall, 8" deep, and 12" wide, and it's new in the original box. The was only $6.00! I buy cabinets and chassis whenever and wherever I find them, and then worry about what I can use them for.

The projects you're contemplating sound like something I'd build! (see my web site, http://www.qsl.net/k5dh)

73 and good luck!
Dean K5DH

Mouser has a respectable line of aluminum and steel chassis in their catalog. The selection, today, is not what it was back in the 50's or 60's, but you can find what will work. Prices are a lot higher, too, especially for cabinet-type metalwork! I just pulled the '57 issue you spoke of. No problem with the chassis but the cabinet no longer exists from Bud, et al, much less Hammond. There is a fellow who ads in several pubs that makes aluminum chassis and cabinets. He's resonable and I'm sure he can gin up what you need. He's located in the Mid-Atlantic area and I saw him, last weekend, at a local hamfest.

A factor of 5:1 in price?

My local sources charge about $5 per sq ft for 0.040" 5052-H14 aluminum.

A 17x10x3 chassis needs about 3 square feet.

That's $15 for materials, not counting wastage because the local source only sells it in 4x8 feet sheets :-). I compare that to $25 for a Hammond chassis of the same size already made and spot welded, and I don't see as big (5:1 or 7:1) of a disparity in prices as you do.

Now, I can get little (square foot or two) aluminum cutoffs at some scrap piles for a lot cheaper, and those work great for tiny little subchassis or miniboxes, even better to do it myself there because dimensions are often critical.

Maybe I'm buying really super expensive aluminum and you know where to
get it for $1 or so a square foot. If so, tell me where!

Tim.

For many years I worked for other people on the daily grind. 9 - 5 and much
longer
hours for what now seems like very poor pay.
I suppose looking back on it now, I didn't really know how trapped I
was until I discovered an easy way to make money using Ebay and the
Internet.
Since then I haven't looked back and have been making money
consistently. For a long time now, I have been developing a number of
interesting methods that can realize lots of money both on and off
ebay. I am now offering you the opportunity to do the same.
Each method is completely legal. There are no pyramid schemes, MLM
schemes, affiliate programs, investment schemes or adults only
business. This is not dropshipping, misspelled ebay adverts or
selling
for other people.
I am offering you the chance to make enormous amounts of money both

on and off ebay!

Are you tired of 'Get Rich Schemes'? Well you can relax and purchase from someone with an excellent reputation.

I have been making a living online now for many years and have a number of different ebay ID's from which I sell. I do a lot of different things both on and off ebay and make a profit from all of them. I have found enormous success in four key areas that I am now offering to you.

These methods are not diet pills, pyramid schemes, affiliate marketing, or running a website, just four incredible opportunities for you to make enormous amounts of money.

'I don't just sell these methods, I guarantee them. And if you don't succeed then I'll give you double your money back!'

WHAT I OFFER

Four great systems for generating fast cash

Antique Electronics Supply, Allied Electronics, and Newark Electronics all carry either the Hammond, Bud, or LMB chassis.

==========================
Over the years I bought some large size sheets double sided PCB material
at flea markets.
Provided there are no heavy transformers ,both chassis and enclosure can
be made of the material.
Under chassis screened compartments can be easily included.

================================

The likely reason is that the FCC considers the device a CB power amplifier . Lately this federal agency has stepped up its combat against the sale of these illegal amplifiers.

Some time ago a US road side truckers-centre selling illegal devices was heavily fined.

Hi'ya Jack,

My Viking Adventurer is on the air nightly. In fact for over 2 years it has been my "primary" rig and that is using only crystal control.

I am sure you can find the parts list on BAMA but if not send me an SASE (via my QRZ.com address) and I will photocopy it for you.

Good luck.

ZUT es 73,

Vern W9STB - WPE9GHF

Considering his retail outlet, Ebay, has blocked every attempt to sell the product, His sales has probably been rather low. Thus not profitable. Also the fact that the amp is rather low powered for most "competition" CBers and with the plethera of older 100+ plus ham rigs out on the market, there is not a large market for his amp. Who needs

an five watt radio, and a 100 watt amp to drive a big competion amp
when you can get a Kenwood TS440 or similar and use it.

james

The Knight T-50 and I think Heath's AT-1 also used the venerable
807 in the PA.

Pete

Looks unused, in original box. With conversion data (simple),
will do 100 Watts out with 10 mW in at 902 MHz.
Nice amp for 902 weak signal work.

$75 plus UPS from 02421.

Thanks, Dick, W1KSZ

The Irvington High School Science Club is announcing the creation of a New High Altitude Balloon group. High Altitude Balloons are Helium filled latex balloons that fly at altitudes higher then 85,000 feet (some make it to over 140,000 ft). Amateur Radio is used to track the balloons during the flight and after landing The group will be called "New York Near Space Research" or NYNSR for short and will be conducting flights by late Spring next year in the Lower Hudson Valley. We are hoping to have a website purchased by the end of this weekend and have some more information available. We have started a public Google group under the name New York Near Space Research already and you may join if you like.

73 to all,
Javier Anderson, KC2MFC

Hadn't thought of the vertical Tom. But good point. I do recall years
ago, seeing vertically mounted ones used as stage light dimmers, now
that you mention. Fans good idea too. While all of this was a reaction
to the original basic question; interesting how one idea leads to
another, eh?
Regards.

I keep seeing caps described as "computer grade" but a search for a definition comes up with zilch.

What does this mean? As the vast majority of computers are owned by the masses, one could assume it means sleazy consumer quality. Or it could mean the kind of computer that prevents ICBM's from being accidentally launched.

Which is it?

The name has been around for much longer than PC's, so I assume that it
means _mainframe_ computer grade -- today we'd say "server grade", I guess.

At any rate, if it has no legal meaning then it could be a total lie and
no one would be subject to any legal penalties (marketplace penalties
are another matter).

I have always taken it to mean _really_ _good_, but you'd have to go
over the specs to see, then extend some trust to the manufacturer.

Hi,
I have just acquired an old home brew radio. It is a 5 tube
regenerative receiver. The tubes as best I can make out are
Cossor 215P BVA, Mullard PM1HLx2, Mullard PM2DX and a Mullard 2M1HF.

Does this ring a bell with anyone. Does anyone have or can point me to
Schematic.

Many thanks
Ian

Not a lot. It is just one of those meaningless terms
like military spec.

This is what passes for 'computer grade' these days:

The term was around in the early seventies, at least. That was when
solid state was still relatively new, and electrolytics were not
as advanced as nowadays. I built 1A power supply in the fall of 1972,
and had found at a hamfest a "computer grade" electrolytic, in a
metal can,10,000uF at about 20 volts. It was about the size of a Coke can.

It was pretty massive in terms of capacitance at the time, the regular electrolyitics were hard to find in such large values, and even this one was barely sufficient in terms of voltage rating.

It was obviously surplus, from mainframe computers. I have no clue whether they were particularly better than the regular electrolyitics, but they were obviously the source for larger value filter caps at the time. I'm sure some of it was merely hype, at the very least "computer grade" says where the capacitors came from.

It's obviously different now. I can easily get 10,000uF electrolytics in a far smaller package and with a bigger voltage rating. I haven't evne noticed the term in a long time, other than the occasional question about the term (it has come up before here or in one of the sci.electronics.* newsgroups.

There obviously are different grades of electrolytics, with things like temperature rating being important in some applications, and ESR being important in others (especially things like switching supplies where they have to deal with higher frequency waveforms). But the talk is in terms of their specs, rather than some mythical "computer grade" capacitor.

I'm a professional electronics engineer (not rf enginneer though), and what I really find frustrating about radio projects is the uncertainty!

I spend hours designing and analysing filters. Designing oscillators and minimising harmonics, noise etc. Then I cheerfully commit it to a PCB (I tightly laid out surface mount PCB to minimise layout inductances etc).

Nothing ever works as simulated. Transistors never have the rf gain as SPICE seems to suggest.

And local oscillators...well carefully chosen components just get thrown out the window to be replaced by more and more random changes in component values.

If it does finally work, I'm left feeling nothing like an exacting engineer, and more like an artist that has piles on layers and layers of oil paint till the right effect was achieved.

I now find any mention of the 612 mixer and its (non)osclillator gives me panic attacks. (well i'm currently trying to get it to work at 130Mhz with voltage tuning).

So I wonder, what would be your top tips for someone moving into the radio design arena? Are there hidden secrets that nobody tells and the books omit? I'm not thinking about PCB layout here, more things like, are simulation programs of any use (if so which ones) and what kind of design procedures can result in predicatable results?

* Model your parasitics, including circuit-layout induced ones.
   * Remember that _everything_ has parasitics if the frequency
     is high enough.
* Transistor models are never perfect; you need ones intended for
   use at your frequencies.  RF transistors should have models that
   include package effects.
* Tightly laying out your circuit board will reduce inductances
   but increase capacitances.
```

- There are (very spendy) packages that will do parasitic analysis of your PCB layouts that you can then run through spice.

It is an art, and one that I haven't mastered myself, but you can put a lot of science into it if you're careful.

I first ran into computer grade caps back in the 1970's, back when I was building my first homebuilt computer (before the masses owned computers), I considered it a pejorative, in that it was only good for building power supplies for computers. Would it be be better if it said low voltage dc power supply caps? Those big coke can sized caps made great smoothing caps, along with some smaller caps they could knock ripple down to where you needed an oscope to see it. Just don't build a supply with that as the only cap on the output, they are ok on low freq swings, but also add a 1k and 10 uf cap to help clean up the rest of the ripple.
thanks John.

There is, or was a site on the internet that had these sorts of high energy items. Tesla coils, magnetic coin mashers, capacitive discharge banks (which sounds like what you are describing) etc.

Basically you are going to charge up a whole passle of high voltage caps then short the output so that you create a minature lightning bolt, thus the boom. Too dangerous for me. Not to mention the amount of magnetic pulse you are going to let off right close to the audience's cell phones, laptops, handhelds, etc. I wouldn't want the bill for repairing everyone's electronics after you scramble them.

thanks, John.

I am a real _amateur_ ham operator. I _love_ to make homebrew stuff but with tubes (not solid state), and will offer MY version of your story.

> I spend hours designing and analysing filters. Designing oscillators and minimising harmonics, noise etc. Then I cheerfully commit it to a PCB (I tightly laid out surface mount PCB to minimise layout inductances etc).

I do tinkering (not _engineering_), and do pretty sloppy, ugly, breadboard construction of:

1. the real thing
2. only a small part of the whole project at a time
3. turn on "the juice" for the smoke test: results: 1-smoke and no action (then scratch head), 2-no smoke but action (cigars for all), or 3-no smoke & no action (also scratch head). There are variations on this. Beyond the scope of this post.

> Nothing ever works as simulated. Transistors never have the rf gain as SPICE seems to suggest.

Decades ago I built, in a physics research lab on a university campus, several dual-delay line pulse amplifiers (5-6 tubes, fancy delay lines). All identical parts, identical schematic, identical tubes. One of these amplifiers put out a trailing spike that was not supposed to be there. I tried everything to figure out where it came from. I spent weeks on this. Finally, I put in a bypass cap that was not supposed to be there and that fixed it. Told the boss about all this. He shrugged his shoulders.

> And local oscillators...well carefully chosen components just get thrown out the window to be replaced by more and more random changes in component values.

I have found commercially made components that were crap. eg. Precision resistors 20% off value. Parts dead out of the box.

> If it does finally work, I'm left feeling nothing like an exacting engineer, and more like an artist that has piles on layers and layers of oil paint till the right effect was achieved.

The object of the game is to get stuff that works and forget the castles in the sky. Oh, yes, I worked at a place where another guy--making very

very very fancy-schmantzy stuff--built a circuit according to "plan" and it didn't work either. Much cussing, grunting, cussing, yelling-and-shouting-and-huffing-and-puffing and in the end, I recall that they pulled a kludge fix, too.

> I now find any mention of the 612 mixer and its (non)osclillator gives me panic attacks. (well i'm currently trying to get it to work at 130Mhz with voltage tuning).
>
> So I wonder, what would be your top tips for someone moving into the radio design arena? Are there hidden secrets that nobody tells and the books omit? I'm not thinking about PCB layout here, more things like, are simulation programs of any use (if so which ones) and what kind of design procedures can result in predicatable results?

I don't know about _you_, but for me, I do better when I build small parts of the whole thing, then test them individually, and I have minimum test equipment (oscilloscope, meters, signal generators) and you can put inputs, measure outputs, measure voltage & currents, and tinker and adjust as you go.

You sometime have to test the part separately from the circuit to actually prove to yourself that it really does work. Its a big pain, but it makes you check everything.

You might ask yourself if you are assembling things with good techniques (yes--I kid you not--I have actually run into people who did not know that you had to strip the insulation, whether enamel or plastic, off of wires before putting them into sockets or clips) including soldering technique.

Oh, yes, since I work with tubes that run hundreds of volts on the plates-screens, yes, I've gotten a few electrical shocks (they hurt, and at higher current, burn flesh) but also be careful about not having a finger from each hand in contact with "hot" metal conductors. High power RF also burns flesh and feels like heat rather than pain and you might smell burnt flesh (its terrible) before you feel anything.

Excellent...!! Professional engineers also spend a lot of the time in the lab waving their arms in hopes that they can dissipate the smoke before someone runs in to see where the bang came from!

I dont mean to be too highbrow...its just Ive spent so much of my working life ensuring that if you build something on a production line 100,000 times 5% failure is pretty bad. And people obviously build small transistor FM/AM/shortwave radios in china with the worst cheap components...and most of them seem to work of sorts. Though i have designed high end audio amplifiers and each time a new batch of capacitors came in there was lots of "listen tests" as amazingly you really could here 100nF placed on a supply line (dont ask me how...I still dont understand it).

If the pro rf engineers do too much of the "try it and see" approach they deserve their sky high salaries for the loss of hair and frayed nerves waiting for the customer returns from their first 10,000 units!

I did wonder whether selling the car and buying some impressive test equipment would make me feel better ;)

Look up Marx Generator on Google and see if that descibes the circuit.
Often used to simulate lightning discharge.

$200 at local hamfests and some cheap gear will get you most of what you
need. I bought a decent audio gen for $15, a decent RF gen for $3, and an
old tektronix scope for $45 (but it crapped out just recently [or, I
should say that it craps out after it warms up]). I do fine.

I have a couple of ADSP-2181's burning a hole in my junque box. Yes, I know they're a little slow and 'dated', but they were free and I thought they'd make a nice platform for a learning project, perhaps an IIR or FIR SSB filtering scheme.

Any of you done any designs with this, or have any non-proprietary app notes for this device?

TIA & 73, RDW

>I keep seeing caps described as "computer grade" but a search for a
>definition comes up with zilch.

In the 1960/70's computers were the only application requiring very low voltage stabilised DC power supplies, +5 V for TTL, +6 V for DTL and -5.2 V for ECL. Other high power DC applications in those days, such as industrial automation, used 24 V, but relays weren't sensitive to ripple or voltage variations.

When a typical computer consumed several kW at 5/6 V, quite huge DC currents were required and thus the power supply capacitance in linear power supplies had to be huge.

I have seen this "computer grade" term used in the 1970's when some surplus companies tried to sell some huge size capacitors, when physically smaller capacitors became available with the same capacitance, in order to justify the size of the surplus units.

But after the 1970's I have never seen the term "computer grade" used.

```

We dont seem to have places where you can get cheap stuff in Britain. I tried to buy a spectrum analyser from ebay last week, good job I didnt pay it was a con artist. Problem is with kit like spectrum analysers is that you need something capable like an HP, otherwise its can be next to useless. And everyone seems to know the value of an HP856xrange unit, being $4000+!

I did once go to a ham radio show just outside of london, nothing cheap there though. Though I will remember two enthusiastic bearded men who were each looking through boxes of junk at opposite ends of a stand, they had their head in their boxes and were talking to each other on radios..saying "bill theres some good stuff in this box, over", "george..yes Ive found some great stuff in here, over"!

Meanwhile...I have a 612 based colpitts oscillator which on test works at 110Mhz with 10pf base/emmiter and 22pF to ground on the emmiter. But curiously jumps up to 210Mhz when I double the 22pF cap to 44pF. Ive got a frequency counter via a FET buffer showing those frequencies, and (with the counter turned off) I can verify the frequency with my portable scanner set close by. So increasing the capacitance doubles the freq of operation!? I do wonder whether the spectrum has just spread into harmonics...but i cant find them on my scanner...and wheres that HP spectrum analyzer..hmm

If anyone out there knows why increasing the emitter ground capacitor in a colpitts will increase the frequency I would be very happy to be educated! Given that the freq should be the emitter ground cap in series with the emmiter base, in parallel with the inductance. Which is 100nH, with a 1/2PI ROOTLC tuned circuit relationship.

Happy happy happy...

Hi,

Re: array processing / analog to digital cards

I would like to process signal from an antenna array with 8 elements. Initially I was thinking of using an A/D card to digitize, with 8 input ports for 8 antenna array. Each antenna would have its cable coming into each port (assuming no RF analog) on to the card

But recently a friend told me that a "multiplexer" can be used to multiplex the 8 antenna signals into one and piped to a single port of A/D card. That way a single port (cheaper) card could be used and less hassle with cabling.

Assuming the bandwidth to be received/processed is 30 Mhz and the A/D is 70Mhz, can someone pls guide me:

1. Can such processing be done using multiplexers?
What are the drawbacks in terms of losing signal info, etc.

2. What are the important specs/considerations when dealing with multiplexers in such a setup?

3. Can you recommend a brand?

4. If multiplexers are not useable, can you suggest a cheaper alternative to buying a 8 port A/D card with 8 a/d chips, etc.

Thanks

Russ

The multiplexer works like a switch: it connects channel 1 to the ADC, then channel 2, then channel 3, etc. Because you have eight antennas to sample, it reduces the ADCs effective sampling rate by a factor of eight.

The multiplexer itself won't have perfect isolation from one channel to the next, and the ADC (and the multiplexer's back end) won't settle infinitely fast, so if you're switching things quickly you will see some settling-time induced cross-talk between antennas. These two effects may be severe unless you spend as much on your multiplexer as you would on seven ADC channels.

Electronic analog switches like the ones used in multiplexers will attenuate your signal. A discrete multiplexer using PIN diodes will minimize this (and be expensive), a multiplexer using monolithic silicon switches will be worse.

Other than that, and all the stuff I haven't thought of yet, you should be A-OK.

Oscillators are very tricky to design using tools like SPICE. Most simple oscillators by definition build up in amplitude until the device goes nonlinear and loop gain becomes one. SPICE models outside the linear range are often very poor.

And a very important factor for oscillators, is that we often require that the oscillator start reliably at all corners of the gain/temperature space, but SPICE models usually sit squarely in the center of gain/temperature space. SPICE models for crystal parameters are largely nonexistent or very proprietary and again don't cover all corners of gain/temperature space.

> So I wonder, what would be your top tips for someone moving into the radio design arena? Are there hidden secrets that nobody tells and the books omit? I'm not thinking about PCB layout here, more things like, are simulation programs of any use (if so which ones) and what kind of design procedures can result in predicatable results?

Canned crystal oscillators are a good choice if they really, really have to start reliably. Many handbook recipes for oscillators are not necessarily reliable starters.

Simulation for oscillator design was a laughable concept when I first learned SPICE in the 80's. Today we have more CPU power, but the models are the weakness.

If you are working in the VHF/UHF range, amplifier design usually starts with a transistor model for the frequency range. It's rare to have to get into SPICE.

Tim.

You seem to think that the multiplexer approach will give you something for nothing - it won't. If you replace eight 70MHz A/Ds with one A/D and an 8-input multiplexer you'll have to sample eight times faster - i.e. at a rate of at least 480MHz. What is more, you will need a multiplexer that can switch at 480MHz - i.e. spend only 2ns on each channel. In that time all switching transients - and the signal itself - must settle and THEN, the A/D perform the conversion.

Not mission impossible, but if you need to ask these questions, you might find this project quite difficult.

John A

Greetings:

If anyone has access to the service manual for the Grundig YB 400,
I would very much appreciate a look to see if it has pictorial
component call-outs before I start a tedious visual tracing
effort. (I am in the midst of a controller redesign for this
radio). The bulk of the discretes (mostly fine-pitch smt) are
on the solder side and I will need to identify the location of
Q's R's C's and D's.

Thanks for any help.

Regards and 73,

Michael

Yes, take a look at most amps including the one you are using the antenna
realy is probably nothing special, just a heavy duty DPDT relay.

10p-22p-100nH should run 200MHz!. The 44pF cap sounds a bit dodgy for HF osc operation.
Oscillator caps I use for the (later version) SA602 mixer are usually 5pF-5pF.
A 110MHz-210Mhz design earlier this year used 5pF-5pF-100nH and 2 back to back SMV1259 varicaps.
And yes, above about 30MHz concrete account has to be taken of the layout wiring and parasitics. Modelling will get you maybe 70% of the way there, invisible factors the other 30% :).
Most important of all is minimising or allowing for the effect of test gear and it's connections. From bitter experience I realise it's a skilled artform that can only be acquired through doing.
And yes, the more test gear the better. Come what may, buy that speccy analyser!.
If you ever come across designs where the author indicates possession of only basic test gear then be wary. Very wary!.

This is really useful. I'd neglected to mention the other 22pF cap in parallel with the inductor(in the test circuit, to be replaced by a varicap with 1nF DC block in actual design), and with circuit parasitics it runs at about 110Mhz. I actually doubled the 22pF cap in the emitter/ground (two 22pF caps in parallel). So one 22pF was 110Mhz, and two in parallel was over 200Mhz! So theres the quandry.

My main circuit uses one varicap diode, can't use back to back as I need the whole cap range. Ive realised that just connecting a 10k pot (in my test circuit) to a 47 series resistor onto the diode (as seen on several circuits on the web) is a bit dodgy as the effect is not linear (presumably because the ends of the 10k pot create a lower rf impedance).

I was also wondering whether my surface mount 100nH inductor has too low a Q to be stable (49). Might be causing some of my more random affects.

The switch has to handle not only the 50 ohm input, but the output, whatever that may be. Note that 2kW at 10 ohms is 14 amps RMS, and at RF where the current flows on the surface of the conductors and resistance is quite a bit greater than at DC, you can get a lot of heating with 14 amps. And note that 2kW at, say, 600 ohms is over 1000 volts RMS. At that sort of power level, where you don't really know what impedance you're driving, I'd suggest you should be using a pretty heavy-duty ceramic switch, heavy contacts and wide spacing. I wouldn't even think of using a "miniature" switch in an application like that.

If things stayed at 50 ohms, you'd only need to handle a relatively
puny 6.3A and 316V RMS, but if things stayed at 50 ohms, you wouldn't
need an antenna tuner, would you?

Cheers,
Tom

At 44pF the emitter feedback factor is only about 0.2 and moving into an area where a Colpitt may fail to oscillate and all bets are off.
Could be the osc' is running into a on/off squegging mode and the counter is picking up the 2nd harmonic of a grossly distorted waveform. (a speccy would show this instantly).
The 47k series R is fine. The diode can see as loading a min of 42k and a max of 52k, which essentially is a zero load on the dynamic resistance of the tuned circuit, which may only be a few kohm at best. (a variable R loading of this nature has only trivial effect on an oscillator)
A Q of 49 is perfectly OK to run the Colpitt. In practice, higher Q's will offer maybe a 10%-20% increase in maximum attainable oscillation frequency.
The 100nH coil I prototyped was 5 turns of thin tinned wire wound round a pencil. Doesn't sound much but cost nothing and gave a Q of 180!.

(as an isolated side note, the same coil using Gold plated wire gave Q =180 and the same with Silver plated wire Q=200)

The term "computer grade" is in use today. See
http://www.mouser.com/catalog/629/576.pdf
and
http://www.mouser.com/catalog/629/574.pdf
for examples of those currently manufactured by Vishay/Sprague and
Mallory/CDE.

I suspect that the term "computer grade" signifies capacitors with screw
terminals. However, I can't prove it.

Cheers,
John

a guy has a 6m amp for sale that uses an 811a. in GG configuration. Is this possible with reasonable gain? The amp appears to be built well and I will probably buy it just for the parts before the week is out but should I expect this thing to really work on 6M.

Of course one would assume the only time he would use the switch is when
working into 50 ohms, either the input to the tuner or the input of a 50 ohm
more or less antenna.

Digging out the 1968 Newark catalog, on page 332 are the Mallory CG
series of big can capacitors in a section titled "Computer Grade
Electrolytic Capacitors". ie -10+75% tolerance, -40/+85 deg C temp.
$10 was a lot for a capacitor in 1968.

"Computer Grade Capacitor" might possibly refer to the low value of internal
series resistance and inductance which are important parameters in switching
regulator power supplies.

;-) Well, when I read "switch the transmatch in or out of the circuit," I envision switching both ends of it. If indeed it's a switch to select between antennas that don't need a tuner and one that does, where that antenna is always connected to the tuner output, then a more modest range of impedances could be assumed. I'd assume at least 2:1 SWR relative to 50 ohms, though; a typical 2kW amplifier would have a tuned output that likely could handle that range easily. So even then you're getting into possible currents and voltages I wouldn't trust to just any old switch I found kicking around. I do understand that a common ham design philosophy is, "build it with whatever's around and if it fails, rebuild it with something a bit beefier." I'd prefer to put a bit of thought into the anticipated worst-case stress levels before I build it, but that's just my personal feeling.

Cheers,
Tom

I used an amp with 572Bs for many years. With an untuned input, output
ran up to 600W PEP for 100 in.
This suggests that the 811A would work but at some lower power. What
does the owner say about input and output power?
John

Thanks for all the replies.

The chassis is very professionally done. The wiring is not so well
done. The filter cap wiring on the transmitter socket divider is a
joke. Thus the idea of a kit seems reasonable. There is only one
crystal socket. So the Knight Kit seems to be out. Family issues are
keeping me from more work on the rig right now, So I'll have to just
wait see what else is posted here, for a while before trying to draw a
schematic

I really am impressed by those that want to help, plus I've learned
some things.

Thankjs again.

Jim

What about that old Hammerlund CB...was it called the HQ-105? or something like that. Possibly someone put on a different front panel and it now looks to be homebrew?? Just a thought.

The CB-11 has only one crystal socket - for the transmitter.

best regards...

Jim,

I suggest you post pictures in alt.binaries.pictures.radio, and post a
pointer here, so that viewers can see what we're talking about.

William

Hi Terry

That's what I was wondering, the mass of the heatsink
the windings are on should have a bearing on
the wattage... Lacking manufacturer data I guess it
is a moot point and I'll take a conservative tack..

Pete

I second dropping the first filter capacitor. It will lower
the voltage and reduce the strain on the power transformer
as well.

The manufacturers, all I've ever seen, take that conservative tack and just put a maximum current rating on them. In the case of a rheostat, you need to consider the rating of the slider, and I'll bet you get longer slider life if you adjust it when the current is zero than when it's the full rated value.

What Terry wrote has a lot of merit. In fact, with the tubular ceramics with a hollow core, you could quite reasonably get more dissipation with a given temperature rise if you orient the resistor vertically in free air, as opposed to horizontally, since it acts like a stack and will get considerable air flowing by virtue of the heat. If you REALLY wanted to optimize such a resistor, you'd space the turns further apart on the end that was going to be on top! Also, I can tell you that little 0603 surface mount resistors, nominally rated at 1/16 watt, can dissipate a whole lot more (1/4 watt!) than that if you keep other heat dissipators away from them and provide wide copper paths to lead the heat away from them; but on the othe hand if you put a whole mess of them as close together as your design rules let you and ask each to dissipate the same power, you'll find you may not be able to go above 1/100 of a watt each without getting them too hot. So not only does the amount of the rheostat in actual use make a difference, it makes a difference how you cool it. Turn a fan on it and don't adjust it while it's got current through it, and you MAY be able to safely add 40% over its current rating. YMMV, though. You know what to do to be conservative.

Cheers,
Tom

Let's start at the beginning.

You have a power transformer and a rectifier, followed by a C-L-C filter (aka capacitor input). And you're getting a bit over 500 VDC from it.

1) What rectifier circuit are you using?

a) full-wave center-tap
b) full-wave bridge
c) voltage doubler
d) some other type (specify)

2) What sort of rectifier(s) are you using?

a) High vacuum diodes (5U4G, 5Y3GT, 5R4GY, etc.)
b) Solidstate silicon diodes (1N4007, etc.)
c) some other type (specify)

3) What are the transformer ratings, part number, etc.?

4) Which of the listed transmitters have you built?

It may help to post the date codes from other components
and also make, model and manufacturer of your device.
At first glance the 'top markings' look like a house number.
Also, what is imprinted on the underside of the device?

Regards,

Michael

Generally, 6 pin DIPs are optoisolators.

There must be exceptions, but every time I see one I start
with the assumption that it's an optoisolator.

I think the second choice would be a pair of transistors.

I vaguely remember Motorola's odd, short-lived
line of linear devices back in the 60s or 70s..
MFCxxx rings a bell. They had attenuators, oddball
audio amps. I think there were some six pin devices,
but they were also an offset lead package.

I have 8 of these, raw chips, not part of an assembly. There are no
other markings.

For general information on "first CBs:"

The September or October, 1958, edition of Radio and Television News magazine (available then at most newsstands) carried the news of the opening of Class C and D Citizens Band service. The month was probably October since the news was on one page of "latest news" which went to [printer's] bed the very last.

The March, 1959, issue of Radio and Television News carried an article by Don Stoner as a how-to-build CB voice transceiver with full plans, parts, etc. That issue was popular in the southern California aerospace community at the time with many attempting to build it but few succeeding in getting a working unit. Don Stoner was one of the frequent authors in the popular magazines of the time, would later team with Pierre Goral to form SGC [Stoner-Goral Company] in the Seattle area. Both are SK but SGC lives on.

A number of copy-cat kits went on the market soon after, most being variations of Stoner's article. My own experiment was a converter for an AM radio as a receiver, similar to Stoner's "Q-Fiver" other-magazine article on an HF converter for a WWII surplus ARC-5 Command Set LF receiver. While that succeeded for me, the transmitter part didn't work well, a result of my ignorance in low-power RF design for AM stages at the time. Several months later I bought an E.F.Johnson Viking Messenger CB transceiver and used that in an aluminimum-body Austin-Healey sports car (ideal ground plane for mobile).

Since the FCC did not specify type-acceptance per se on CB transmitters until years later, nor directly say that "home-built" transceivers could not be used, the first two years of "11m" CB was an open field to play in and there were many variations. In that shake-out time, general design of first transceivers was a single-conversion superhet receiver with crystal-controlled LO, a 3rd-overtone crystal oscillator to a plate-modulated power amplifier for the transmitter, AM from using the receiver's audio output stage as modulator. AM was generally "down-modulation" with carrier going from about 1.4 times quiet CW level to zero, more a result of tube stage saving and low-level drive to the PA. It was one pair of crystals per channel, the expensive part of operation; surplus quartz crystals from WWII were available from many small shops at the time so it was not a great barrier. Mobile operation required the old "vibrator" supply, always a troublesome thing for any mobile equipment needing HV from before WWII until after. Power-transistor multivibrator switching supply substitutes for vibrator supplies was not good due to (generally) horrendous spikes and RF hash generated by early power transistors and diodes with insufficient switching times. Still, it was a fun time of experimentation for thousands of home-brewers then.

Frequency synthesizers for "all-channel" operation didn't appear in quantity until designs went solid-state. A few tube designs used "channel-bank" mixing of two crystal controlled oscillators to cut the number of crystals needed, an architecture carried on when CB went to 40 channels in 1977. In the 1960s the lower-cost off-shore-made CBs hit the market and were a hit with truckers on the interstates; the FCC tossed in the type-acceptance rule and that pretty much reduced the CB home-brewing projects.

Although the FCC required licensing of 11m CB in the beginning, there was never any associated test and the "license" was a pro-forma Third-Class Restricted Radiotelephone type, similar to what was required of private pilots using civil aviation radios. Through some oversight, the FCC assigned license call-signs with a prefix of "11W," this got them in trouble with the ITU and international agreements. For a brief period CB licenses were issued with "K" prefixes before regulations removed the need for licensing.

For illustrations of early CB, go to www.retrocom.com, a large
website of stories and pictures of CBs.

Were them "CB callbooks? Does anyone have them? I had a CB license in
the "K" era (circa 1979). and have long since lost it. I would like
to look up my call.

Geoff.

Found the following on the NTEINC web site.
```

Replace part....	With NTE part....	Product Line	Data Sheets	Notes
65-01	NTE3040	Semiconductor		

NTE3040
Optoisolator
NPN Transistor Output
6 lead DIP

1 -- Anode of LED
2 -- Cathode of LED
3 -- NC
4 -- Base of output transistor
5-- Collector of output transistor
6 -- Emitter of output transistor

That was a a really weird line. I seem to recall some were actually four pins. They seemed for much intended for consumer equipment, and it seemed like they tried to fit the package to the device, rather than have something like a 14 pin package and have everything fit in it no matter how few pins they actually needed.

I think some of the line included dividers that would run off 12v, intended for music organs.

I honestly did not include those in my "there must be exceptions". I'm not sure now if I put that in just to be sure, or I was thinking of something (that I can't remember at the moment) that do come in 6pin DIPs.

My 1996 edition of the ECG Replacement Catalog lists the ECG3040 Optoisolator as a replacement for '65-01':

Output: NPN Transistor, Viso=7500V, Pt(mw)=250 Ic/If=20%,
If(ma)=80, Vr=3V, BVcbo=70V, BVceo=30V, Ic(ma)=3.5 Ftyp=300KHz

Basing Diagram (top view)

```
     ---------
   A| 1     6 | Base    A = LED anode
    |         |
   C| 2     5 | Coll.   C = LED cathode
    |         |
    | 3     4 | Emit.
     ---------
```

Regards,

Michael

Hey all,

Would an air-gap tuning capacitor intended for transmitting hook up any differently from an air-gap tuning capacitor intended for receiving? I built a project following the schematic for a commercial product, but the (intended for transmitting) capacitor doesn't like being hooked up with the stator grounded. Can't figure out how to make it work the way the schematic is drawn, so I ungrounded the stator and take the input for the amplifier from there instead of the rotor. And doing this, it works fine. Anyone have any input? I'm all ears...

Thanks,

Dave

I don't recall any "CB callbooks." Doesn't mean they don't
exist... :-)

Its not the cap. The main difference between receiving and transmitting variable air capacitors is the voltage rating. Since transmitting capacitors are made for higher voltages they have greater plate spacing and consequently larger plates for the same capacitance. without seeing the circuit I can't guess as to what is wrong.

No difference on the hook up question.

If you ground the stator the the shaft to the rotor will be "hot" and
that is probably your problem.
You can operate that way but you have to use an insulated coupling on
the shaft to the rotor.

Depending on the use, even that might give you trouble.

Most air variables are rotor grounded,,,stator floating ...Frame
grounded same as rotor..  HS

```

The stator assembly is usually insulated using a ceramic
like insulation, or phenolic. It is normally the "hot"
side of the capacitor. The rotor assembly and shaft are
usually part of the frame, and is grounded when mounted
to a metal chassis.

Pete

Thankyou so much!
Measurements with my ohm meter seem to agree with this.
Now if I could only remember what I bought them for...
Must have been at least 15yrs ago.

he
> stator grounded.

What is the circuit, and why would you want to ground the stator
instead of the rotor?

>=A0Can't figure out how to make it work the way the schematic
> is drawn, so I ungrounded the stator and take the input for the amplifier
> from there instead of the rotor.

I'm not sure what you mean.

Most variable capacitors, transmitting as well as receiving, are
designed so the rotor is connected to the frame of the capacitor.

If one side of the capacitor is to be grounded, it is almost always
the rotor, because that means the capacitor can be mounted directly to
the chassis and the rotor shaft doesn't need an insulated coupling.

If neither side of the capacitor is to be grounded, the rotor and
frame must be insulated from ground. That means the capacitor can't be
mounted directly to the chassis and the rotor shaft needs an insulated
coupling.

>=A0And doing this, it works fine. =A0Anyone
> have any input? =A0I'm all ears...

Need more info on the application and the circuit.

> Dave

Thanks, all, for your input RE: the rotor being normally grounded to frame, etc. This makes sense, as the rotor has threads for a nut to fasten it in place against the chassis/case. Please don't take my silence as not caring/listening-I'm fiddling with it trying to understand what I have in my hands, and how to make it work. *All* of your input is greatly appreciated. Each and every one of you. You have the experience I lack, and I value your feedback.

Trying to put it all into action...

Dave

Quite A number of (Years or Moons ago) depending on how you keep track of time, someone came to one of the hamfests in Gaithersburg, Maryland, in a large box
type of truck, and mounted on top of the truck was a CAPACITOR CANNON of sorts.

I think that I need to clarify a bit - apparently the capacitors did not really explode, but SNAPPED IN DISCHARGE STATE causing a louder than life noise, and could be recharged to do it continuously.

At a push of a button this object sounded like a number of VERY LARGE CHERRY BOMBS going off in succession.

Yes - it was an attention getter.

Does anybody else remember this device and or have a schematic for it?

Alas, doing so today would get one arrested as a terrorist,
or for making improvised explosive devices. They went
after kids around here for filling old soda bottles with water
and dry ice so they'd pop and explode.

The electronics department at Sierra College is moving into a new building that eliminates our need for our two sets of PCB etch/developer tanks. One set is "stock" Kepro and the other has been modified with industrial pumps and nozzles for short run production service.

One set is still in service and won't be available until mid-May. The stock set is on the shelf and available right now.

I'd PREFER to give them to another school or ham radio club for "public" use, but it is first come, first served. The etch tank and developer tank are both the same size and about as big as two desktop computers side by side each. 110vac.

Sierra College is in Rocklin, 30 miles east of Sacramento. Pickup only, no shipping.

A bit in the same direction; the Crofty bomb. A bottle with a solution of
caustic soda and aluminium foil. (Crofty is a local brand of toilet cleaner,
consisting of mostly caustic soda pellets) Easier to obtain than dry ice ;-)

I did a "get directions" on Google Maps. "Leeds UK" to "Rocklin California".
Apart from a side detour via France, direction number '38' looked a bit of a
killer, so I won't bother ;)

My next project is an RF exciter for my 8000 rig.

For sentimental reasons, an 807 must be part of it.

In browsing around, I find the Viking Adventurer to be just about what I
want to do. I found the schematic on BAMA but they do not seem to
have the parts list which would save a lot of trouble.

Does anyone have this or know where I can get it?

Thanks,

JACK K9ACT   http://schmidling.com/radio.htm

Well - I would like to thank everyone here and off line - who submitted a story about getting rid of power line noise, transformers & other hardware falling from top of poles, bottles exploding, etc, but nobody has answered my question yet!

What I am looking for is the object described, to make NOISE. Not interference type of noise on a receiver, especially during contests and the like, but as an attention getter!

Also, this unit would have NOTHING to do with cannons or other types of units set to actually explode say "gunpowder or the likes" that would cause a harmful explosion to damage any person or property!

I have a specific need for an item as of such!! Originally I said that it might sound like a bunch of Cherry Bombs going off, maybe I should rearrange the wording and say it sounds more like the noise coming from the muzzle of a machinegun!

I built one of those for my first station (in North Dakota) in 1955.
I rewired it to use a 6146 about a half year later. I wish I had
kept it. but I have no recollection of what happened to it. I got a
lot of use out of it- added a Heathkit VFO , a homemade AM modulator
(constucte on an over turned aluminum cake pan) and a amplifier with
four 837s in grounded grids. Damn near electrocuted myself on that
amp. I don't have a manual any more - sorry. Just a moment of
nostalgia...

Good luck.

I need to set the tuning on my Sony car stereo from Japanese to US tuning; service manual?

Hi there...

I was wondering if someone has any idea if ANY of the Sony "WX" series of double-din car stereos (japanese or usa models) can be "hacked" so that their tuners can be changed from japanese fm tuning to us/uk or world band tuning and vice-versa???

I recently purchased a Sony WX-C88REC double-din cd/md recorder from eBay. This is a japanese market deck and is factory set for japanese fm tuning. However, the design and physical layout of this deck is very similar to other US models (such as the WX-4500X and the WX-C5000, as well as the WX-C55 which looks nearly identical). I'm nearly convinced that there MUST be some way to hack the japanese models so that their tuners can be "switched" to us or world tuning. I find it difficult to believe that Sony would design two distinct different tuner hardware modules for japanese and american versions. Problem is, I have no clue HOW to "hack" this feature. I don't have a service manual for ANY "WX" series stereos, but I'm thinking that it may possibly be an option in a service manual for ANY of the "WX" decks. Again, I find it difficult to believe that this isn't "set-able" some sort of way.

Does anyone out there have an idea? Does anyone out there have ANY service manual for ANY "WX" series Sony stereo? Or, for that matter, does anyone have a service manual for ANY Sony car stereo that addresses in ANY way setting the tuner for different bands?

I realize there are adapters available to transpose the FM frequencies. I've used them before, always with poor results (stations usually overlap and are weak). I mainly record off the radio with my MDX-C800REC's in my other cars, but always thought it would be cool to be able to dub cd's quickly in-dash digitally without having to mess with a cd changer. But, radio recording is my primary concern...and the adapters don't provide the quality I want for recording.

PLEASE help ANYBODY if you can steer me in the right direction or help in ANY way. If anyone has ANY Sony service manuals for ANY stereo, please let me know...perhaps if setting the tuner IS an option, maybe it is a standard procedure to set ANY Sony stereo's tuning in a similar fashion.

Thank you VERY much!
Jeff

Jack,
How about getting the Viking Adventurer Manual?
You will still need a VFO.

How is that Gareth? Come on, a few published designs of your "biscuits" and your idea will be up and running. However, if you don't progress the idea it will wither and die. That would be a waste of a good idea.

I've offered to assist, if you decline that offer and succeed anyway all the better for you. However, if you don't make this work, then it will reflect on you and you only.

Get baking ;-)

I quite agree, Gareth's idea is an excellent one. I've heard something
similar before (not my idea, someone else's) and it didn't take off. Partly
as there were other constraints which don't apply here but partly as the
originator didn't follow through.

I'd also be interested. However, I seems you and I are more keen to progress
the idea than its creator.

I said not very long ago that someone was being set up to take the rap
for the failure of the project, but I had no inkling that it was going
to be over the issue of free web space, and so soon.

It's all your fault, Brian.....according to one person, anyway.

Do you have an antenna analyzer?

Or, wouldn't it be easier just to use a dip meter to
see where the trap is tuned?

Xref: g2news1.google.com rec.radio.amateur.homebrew:13017 rec.radio.amateur.boatanchors:11330

I recently won a HOMEBREW 23 channel CB receiver. Yes I know it's not a real boatanchor but given that it has 11 tubes plus several diodes , I thought I'd ask about it here. It looks very well made.

I was hoping that some one would recognize it by tube line up. I just looked at it and haven't started drawing the schematic yet. It has the following tubes, 6EH7 (the RF amp) , 12AT7, 12AU7, 6BN8, 6HR6, 6BA6, 6BE6, 6GX6, 12AX7, 6AQ5, and an OA2. It has 6 RF and IF transformers.

The antenna is connected directly to a transformer with the RF amp feed by a cap off the secondary. The first oscillator(?) Uses a 29305 Kc crystal. It has a "S meter" and what I suspect is a meter adj. pot on the back. There is a octal socket on the back labeled transmitter that has two lines jumped as well as a voltage divider with a large electrolytic to ground in the middle of the divider.

The tuning cap is three section with one section switched by a control on the front panel. The tuning cap is driven by a very nicely home made dial cord mechanism with a heavy flywheel. So far I have figured out the RF and audio gain controls. The other two front panels pots function are a question as well as the functions of four multi section toggle switches. With the filter caps being bad. I have not powered it up for more than two minutes.

Does anyone remember a home brew rig with these features HAM or CB? I would like to find a schematic if possible. I looked at the HBR site and it doesn't seem to match anything there. But given the limited 23 channel coverage plus channels A-D it looks like it's from the late 1960's or real early 1970's .

Thanks

Jim

Jim,

I'm very surprised to hear that someone would homebrew a CB rig: I'd

guess it's a commercial unit without the front plate unless the
workmanship is definitely "homebrew".

The mixer crystal is a puzzle: it implies an IF in the ~3.3MHz range,
which I've never seen before. OTOH, if it was made for 10 Meter ham use,
a 29.305 MHz crystal and a 455 KHz IF would work out to either
29.760 or 28.850 MHz, and only the lower frequency is in the 10 meter
band. It might have been a custom-made unit for CAP or other use on
29.76, but I don't have any experience with those.

I'm going to guess that you have a CB set that was modified for either
10 meter ham use or for some quasi-government use on 29.76.

HTH.

William

As intimated by A.N.Other, your sincerity is
called into question.

I proposed a joint effort through Usenet, and outlined how some of these biscuits might be evolved.

You very quickly turned to uttering personal slights
and have continued relentlessly down your chosen path.

Can a leopard change its spots?

IN the sixties (and early seventies), it was common for the hobby
electronic magazines to treat CB as a hobby. This was especially so
for "Electronics Illustrated" that had quite a few construction articles,
going from simple to quite sophisticated. So you could build a panadaptor
to check out the adjacent channels, and a receiver to monitor channel 9
(when it became a designated emergency channel) and even a grid dip
oscillator for "Class E CB" up at 220MHz, even though that service
never came to pass.

THere is nothing unique about the description. I can't recall seeing
much in just tuneable CB receivers in the hobby magazines from that
time, but it sounds like a relatively generic receiver (and he did
say receiver, not transceiver).

If it is a CB receiver, there's nothing to guarantee that it was
built from a description in a magazine article, or that it's a direct
copy of something. Someone could have made it up, or copied something
else with mods for CB. Afterall, no matter what the unit is, someone
has to create a unit before they can write it up in a magazine, so
something can exist without a magazine writeup.

And given that he says it's a receiver, if it was a commercial unit
the pickings are slim. I can think of only one manufacturer that made
a standalone CB receiver.

In the early sixties I ordered one of those cb kits from an
electronics magazine. It consisted of a crudely punched chassis, a bag
of parts and a schematic. I never did get it to work.

Where are these "personal slights"? I offered to help publicise your idea. I've prepared some space to do so or, if you prefer, I will publicise a link to a website you can set up yourself.

So come on, "get baking those biscuits" or I suspect some will conclude your idea was the hardware equivalent of "vapourware".

I thought building a kit CB transceiver was illegal due to the type
acceptance issue?

No Gareth, it was a pointer toward what some may assume.

If you neither accept my offer or publish your ideas elsewhere, who could
blame those who conclude you weren't really behind the idea?

If you don't want to proceed, just say so. Maybe someone else will pick up
the reins and run with it.

Certainly Heathkit got around the issue with their full blown CB set(s)
by having the transmitter arrive as a preassembled module.

But I thought there was a CB "Benton Harbor Lunchbox" for a while,
and I can't imagine they would have a module for such a low end
unit.

So perhaps the type acceptance came a bit later? I can't remember (not
that I was aware of such things at the time, but I have read lots
of back issues of magazines).

In the very early days, there was equipment being made out of people's
garages. So either the rules were more lax then, or from the outside
there were companies selling things that weren't legal.

It may be now, I don't know. At one time Heathkit put out a kit called a
CB-1. This was a simple CB and not at all like the one being talked about.
There may have been others, but this is one I know of for sure.

There was a period, long, long ago, when CB was young, and I was not
yet but a leering glance, that building CB gear was okay.

It stopped being okay before the explosion of the mid-70s.

Gareth's reply to Brian's offer made it clear that he expected far
more than assistance with site hosting, and threw in a personal attack
for good measure, so I suspect your comment is somewhat ill-informed.

Here is the relevant part of Gareth's posting:

>I doubt his sincerity, based on his previous emotional

There's another one.

I proposed a group activity, and you have contrived
to turn it, repeatedly, into gratuitous personal slurs,
completely unconnected with my proposal.

Shame on you.

There were a number of kits as I remember. Heath had several, as did
Allied (Knight Kits). These could be at least as sophisticated as the
mid-range factory units of the day.

I don't know for FETs, but on normal Japanese transistors it signifies the
hFe group (amplification factor).

Are you talking about the dual-gate MOSFET used in some Yaesu equipment?

I think the GR suffix in that case has to do with selection for low noise and low intermod.

Tim.

The tube lineup is from the later generation of miniature tubes - which means mid 60's. It looks like the first conversion oscillator is crystal controlled and the receiver uses a tunable if stage - similar to Drake. That means it would be easy to change thr crystal controlled first conversion stage and cover any other range. Might be a good 10 meter receiver - or perhaps the 12 meter band. There could be some value to a cb collector, since few home brew receivers were made.

One of the pots might be noise limiting adjustment, or one could be for a Q-multiplier.

Colin K7FM

Didn't one issue of like an RCA Tube Manual - have a schematic in it for a
cb receiver or "transceiver"? I know I've seen them out there.

```

A little over a year ago, I posted a request for help (1) in designing
a circuit to get 300VDC out of a power supply that was pumping out
~520VDC. I got many helpful replies, but unfortunately, I was unable
to complete the circuit. I now have three transmitters (2,3,4) that
would like
a nice source of high voltage and I must now admit that I really do
need your help in completing this project.

I own a really nice, heavy transformer that I'd like to use-
unfortunately, the voltage is a bit too high- it puts out ~520VDC
(after a 3-pole filter 10uF/10H/10uF with 40kOhm bleeder
resistor). I am looking for some ways to bring this down to the
voltage I need.

Although I consider myself a competent builder, I am unfortunately not
much of a designer - this is what has prevented my progress for the
past year! I own the '05 ARRL handbook and Art of Electronics, but I'm
just not comfortable doing this myself. Specifically, telling me the
type of transistor/tube and not specifying the part number or an
article describing a similar HV regulator would leave me somewhat
stranded. I know I'm asking a lot here -- please understand that I
am immensely greatful for any of your help!

Here is my specification / wish-list, in decreasing order of
importance:
* produce ~370Vdc at 120 mA
* cost less than $50
* not require modification of the transformer
* also be able to produce ~240Vdc at 40 mA
* also be able to produce ~300Vdc at 70 mA
* be hollow-state
* be elegant

ISTR:

- Heath equipment was acceptable contingent on being assembled
according to the instructions.  There was a notice in some of the manuals
about that - ISTR some devices where one part was a Part 15 label which
the builder was to sign & date & stick to the completed kit certifying
they'd followed the instructions.

- It was legal to homebrew CB gear in the early days of the service, but
that rule was changed - well before the 1960s.  (I'm not sure it was
*ever* legal to homebrew 27MHz CB gear, it may have only been legal for
the old 470MHz stuff)

It may not have been in the US, but before regulation and since
deregulation, one can build up to 5 CB's and call them prototypes in .ca
land, as long as they meet Industry Canada (then the Department of
Communications) specifications.

Maybe it's a Canuck rig?

Cheers,

--
Gregg

That's logical.
But just to nit-pick! :-)
Got one of those ceramic tubular adjustable slide resistors. Rated at
300 watts IIRC.
If I put the slider half way along I will have half the resistance
wire in the circuit and dissipating heat at full current rating;
correct?
But still the same thermal mass of ceramic and metal. So could one
perhaps argue that it might be 'slightly' (very slightly perhaps) a
little more than half the power rating. Probably nothing to have any
effect whatsoever in practice because one would not run a component at
maximum rating at any setting anyway?

G.A.Evans G4SDW wrote:
> Is anybody interested in such a project and prepared
> to join with _REALISTIC_ non-nugatory support?

I am sure that many people would be happy to join in the project, once they see that you are serious about it and have a good idea of the scope that you intend. Why not sketch out some rough ideas, block diagrams suggesting which biscuits would be needed initially (ideally I'd guess some building blocks which could be useful in their own right - e.g. VFO, amplifiers etc.), together with a proposal for how they should connect together - some kind of standardised backplane, a connector stack arrangement similar in concept to PC/104 (http://www.pc104.org/technology/PDF/PC104%20Spec%20v2_5.pdf), something different entirely?

What are you really thinking of here? Is it as simple as "every biscuit shall be either a Xcm * Ycm, or half sized X/2cm * Ycm" and allow free reign on electrical interfaces, or try to work out some kind of standard for general interface levels and protocols between biscuits?

How do you envision the project being managed? What kind of collaboration methods would you use?

The idea is sound, but to spark enthusiasm perhaps you should offer a little more than "Hey guys, let's build a radio". Collaborative projects either need a strong lead or a good previous track record of similar work. Even then take time to get going until people can see where you are heading and that they agree with it and feel they can be a useful part of the project. Throw some basics together, put a bit of flesh on your proposal, and I'm sure you'll get more people interested. It may well end up being you doing it on your own until the first biscuits are designed, but then it should gain momentum. Regularly publish what you are doing and where you are up to; a simple technical report and ignoring those who would shout you down (or a simple technical response, not falling down to "stupid boy" name calling) should gain you support.

Building a CB 'receiver' from a kit can't be illegal.

Do you need to have all three voltages simultaneously?
How good a regulation do you need?
How much do the current requirements vary on each voltage?
Will your supply support 570 volts at 230 ma?

If the currents do not vary much, then why not use a different resistor in series for each desired voltage? e.g., 1666 ohms at (at least) 24 watts, 10750 ohms at (at least) 17.2 watts, and 3900 at (at least) 18.9 watts. For confidence you might wish to use a 50 watt resistor for the first and 25 watt resistors for the second and third. You could have different voltage terminals for each desired voltage. If the voltage decreases under load, then change the resistance calculations.

As a first, simple, experiment disconnect the 10uF nearest the rectifier and reconnect it in parallel with the other 10uF. Then see what DC voltages you get when drawing currents between 120 and 230mA. If it is near enough to the 370v you require, then add suitable resistors to deliver the other supply voltages and currents you've specified and you've got what you need.

Surely there are those amongst us that built 27MHz walkie-talkie
kits from Allied (Knight) and others in the 1960's...

Regards,

Michael

=====================================
Suggest you have a look in the ARRL magazine QEX ,July/August 1999 ,
pages 51 through 55.
"A regulated 2400V Power Supply" , by VE6AXW

In this supply unit the output voltage is controlled by silicon
controlled rectifiers (SRCs) in the primary (120 or 230 V) winding

The principle of this scheme can be readily used for your 370V-DC power supply .
The output voltage can be set to any voltage lower than the one provided by the rectifier(bridge) in the secondary winding at the full supply voltage to the primary winding.

For the other 2 lower voltages you need you can use a zener diode /resistor arrangement with or without a high voltage (use low cost 1500 V type)transistor if you really need a constant voltage at varying load.
Otherwise the lower voltages can be obtained from resistors, as per a previous message in this thread.

The transformer must of course be able to supply the total current you need.
If you don't know the max current which can be drawn from the transformer , you first measure the no-load output voltage and subsequently load the secondary winding with suitable resistors until the voltage has dropped by 5% The relevant current can then be taken as the maximum for the transformer (practical approach)
The max current check can of course also be done with the rectifier(bridge) connected (DC measurement)

Funny, coming from someone in a country that invaded Iraq in WW1, 1941
and basically set up the whole region to become what it is today.

Blame can be cast everywhere, how about casting some solutions for a change?

I have long suspected that "Smiffy" is the name by which
Mr.Nugatory posts when at school, with carefully checked
spelling to put us all off the scent.

The times of posting by "Smiffy" since appearing last November
are commensurate with that of a school-teacher.

Both the subject matter and also the style of language, (in
particular the condescending manner of an arrogant and
deficient personality), in the below are so similar to that
of Mr.Nugatory, that I am now convinced that "Smiffy" is,
indeed, none other than our very own Mr.Nugatory, M3OSN!

What better way after running away and hiding to sneak
back in under an assumed ID?!

Back in the '60's - I was building AM broadcast transmitters, not CBs - however - here in ought 7 - I have a 1962 Allied catalog in which the back section is a KnightKit catalog. On page 408 there is a C-11 Citizens Band Transceiver Kit ($39.95). It transmits on any 1 of 22 CB channels depending on crystal installed, and it manually tunes all 22 CB channels. It does not list the tubes, but does note it's a superhet.

On the next page is a model C-27 Deluxe Transceiver Kit - for reception it too manually tunes all 22 channels - plus has provisions for two crystal controlled channels. The same switch also selects one of two transmit frequencies. This is a dual conversion receiver, and while it again does not list the tube compliment - it does say "7 dual-purpose tubes, 2 single-purpose tubes, VR and rectifier". Since it mentions regulated supplies for the oscillators, pretty sure that's the "VR". $79.95 plus 2nd crystals - $1.95 each (transmit or receive, specify channel).

best regards...

Sorry, not even close (spatially, politically or employment wise)

>
> What better way after running away and hiding to sneak

I posted a helpful reply, with some useful suggestions and a request for more information about your technical and project management expectations. This is _your_ project, how do you envisage it working technically, how will you raise enthusiasm from volunteers and and how will the project be run?

Those are serious questions, that anyone interested in collaborating with you would want an answer to. You are asking for potentially a lot of investment in time from others, which many would freely give if you can show that you too have the commitment to follow through. At the moment I see nothing more than the glimmer of a potentially great idea from you. Will you drive it forward to a successful conclusion, or will you let it drop complaining that no-one would help yet rejecting any suggestions you get?

Why not re-read my words below in a calm manner? They were not written in any kind of vindictive or spiteful manner, they are purely intended as constructive suggestions from someone who has worked on many collaborative projects involving people who live far apart.

G4SDW & "Straydog"

There are many groups on the Internet that are devoted to homebrewing their own ham radio equipment. They run the full gamut of interests from old valve type equipment to the latest in microprocessors and microwave component based projects. You are welcome to join and participate in these groups.

Thanks for the reply; is this RMK Russell King?

Unfortunately, the Japanese datasheet is a pdf of the scanned original and contains no text so I will need to find someone who can eyeball it to do the translation.

Regards,

Michael

A truely excellent idea Gareth.

Why don't you rough out a plan and design a few of these "biscuits" and
publish them on a website or maybe in one of the various journals that
support the hobby.

Good luck and I look forward to seeing your first designs.

Hi all,

Just got an email from SciTech Publishing about a sale linked to their 10th anniversary. Some reading this group might be interested. From their home page at http://www.scitechpub.com/, click on the link just below the banner, "RadarCon 2007 - Take advantage of our special conference prices. "

Though it's mainly books, you can also pick up WinSMITH 2.0 for $89 insead of their usual $125, I think it is, which is a discount from the "list" price of $149. There are quite a few books with "antenna" or "antennas" in the title, though most are a bit esoteric for ham use, and there are some "receiver" books. The discount is 40% from their usual prices for SciTec and Nobel titles, and 15% for others. The 15% may not be very exciting, but the 40% seems worthwhile if it's something you're looking for.

Cheers,
Tom

Well,...Eamon Skelton ,EI9GQ is doing exactly that already..in his
HOMEBREW column in ........... RADCOM.

and  George Dobbs , G3RJV has a similar column in Practical Wireless.

I am sure G4SDW knows that.

March's RadCom had a QRP transceiver with just 11 biscuits. None of
the biscuits had E numbers, and only one had silicon.

Maybe he does know it but that doesn't mean the idea is not a good one.
Truely new ideas are few and far between. I've come across it before as a
suggested way to cope with component obsolesce issues in long service life

applications- a chap I used to work with coined the idea of "tokens" (as I recall). Basically the idea was a library of circuit building blocks that could be assembled to make a larger circuit. If a particular part could no longer be obtained, a new "token" could be designed with a defined interface and functionality.

A sound idea but not an easy project. However, if Gareth can get something rolling, maybe expanding on Eamon's and/or George's ideas, so much the better. I'd not knock the idea, quite the converse.

So get rolling Gareth, let us see some of your ideas on the web or in Sprat, etc.

The seminal book "Solid State Design for the Radio Amateur" (1977) by
Haywood et al had pages of circuit snippets. I also think that PW do
boards for different radio modules. I suppose one might envisage a
sort of mother-board into which modules might be inserted to allow
different designs to be built up? I am not convinced that the idea
will go far though. It is quite easy to breadboard almost anything on
double sided pcb quickly and easily.

True but one advantage of the "biscuit" idea is that you can build and test
them one at a time- ideal for beginners who may be put off by a complex "one
lump" project that they lack the experience to fault find etc.

Really, I think Gareth should run with this idea.

> Few packages will say that directly. At minimum the

> simulation calculations would be done with "single precision" equivalent to 7 decimal digit calculation accuracy. Most seem to use "double precision" or 14 decimal digit equivalents so the simulated oscillationfrequencycould be close to 1 part per million for a very large circuit model (worst case with all errors adding up the same worst way).
>
> MOST IMPORTANT of all is the simulation model and its components, including the stray/parasitic parts of each passive component as well as an accurate model of the active parts (transistor, diode, or vacuum tube). Most SPICE variants have a large active component library and those are quite accurate to nominal operation of the real parts. Failure to model the circuit correctly will result in failed results...one just can't cobble together some parts as on the bench and get some kind of action going.
>
> OK, now that I've done the "spanking" [:-)] about basics, it's time to get the model working. Once that is done, the niceties of checking the harmonics is one of the last jobs. The FFT check on harmonics inPSPICEis probably different from LTSpice because the FFT routines are in the "wrapper" of the SPICE routine's core. Those vary depending on the variants program build.
>
> Good luck on your model.
>
> 73, Len AF6AY

Hi Len,

Thank you very much for your detailed explanation on SPICE. I think a very fast way to find the resonant frequency is to know the critical resonant frequency first, and try to find the resonant period which is corresponding to the highest voltage in the plot. After that, you can do a FFT if you're lazy to convert the time period to frequency. Although this is not very accurate, but this is the most direct way to simulate resonant frequency I guess. Hope my final solution is not too coarse...

Jessie

I have a fair number of medium-sized (i.e. big enough for a 100-watt amp or antenna tuner) variable caps that have one problem:

The spacing of the rotor does not match the spacing of the stator. I can line up the front end to be nicely spaced, but then the back end is too close. Or I can do the back end, and the front end is too close.

I can compromise by choosing a point halfway between the two alignments, but:

Were these old capacitors (many of them from the 20's and 30's) really so poorly constructed that the rotor spacing did not match the stator spacing?

Or is there some long-term "swelling" of the metal parts that results in this misalignment?

I could correct the slightly-off spacing by pulling out the spacers on the rotor and grinding them down just a little bit each (literally, just a thousandth would be too much), but I think there must be something more fundamental that I'm missing :-).

Tim.

Pot metal. It suffers from grain boundary distortion caused
by moisture. The problem is very common in some tuning
caps used in TRF Majestic radios made in the early 1930s.

One problem you'll is that the capacitance will be much
higher than it should be if the plates aren't centered. The

capacitor change isn't linear--that means that equally
shifting the distance between a rotor plate and two
stators from center causes an increase in capacitance.
Intuitively, one would believe the changes would
cancel each other.

Why don't you start us off with construction details and circuit
diagrams for some of your projects, Gareth?

Maybe the Wimshurst machine and primary cells you keep telling us
about. Or those small pieces of test equipment (possibly the
multimeters and signal
generators)? Then maybe your receivers and transmitters after that?

Here's a link to some free web space: http://geocities.yahoo.com/

> sure how it would be derated..

============================
The power rating of a rheostat is based upon its total resistance R.
allowing for a max current I   with P(max) equals I*I*R

If the adjustable resistance is reduced to say 1/5 of the total
resistance that reduced resistance can accept the same current I .
This means the power rating has been reduced by a factor 5 ,in other
words the power rating is proportional to the set resistance.

What I had in mind was a slightly higher level
system view.

So starting at the easy end, we might specify that
the AF amp takes 100mW into 600 Ohms, and
delivers 1W out into 8 Ohms. a biscuit to do that
might take many forms but would all be interchangeable.

If an audio filter were to be included, that would
work in and out at 100mV into 600 Ohms with
0dB gain - and would thus be an optional fit
prior to the AF amp.

I'm not thinking in terms of mother and daughter boards,
but of a set of standard biscuit designs that could then
be assembled into whatever, test eqpt or rig.

Although we'd be using small miniature components (is
anything else readily available these days?) that miniaturisation
does not have to feature in our biscuits necessarily, so
we might have SMDs but spaced out by half-an-inch, or so,
to enable us to work with them.

Setting aside the infantile remarks and attention-seeking
from "the usual suspects", I'm proposing that this be a joint
effort.

Each biscuit would be a standard size or a multiple
thereof, I'd tentatively suggest 1 1/2" X 2".

Assembly of a transceiver would then consist of
biscuits mounted horizontally. The idea is that we
put HB firmly back on the map as the standard
route into HamRadio, so I'm not after miniaturisation.

Perhaps if we could produce rigs of the size of floor
plan size of the old FT101 we'd be OK for easily
doing our own maintenance....we need to ensure room to
get a soldering iron and a probe in there without fear
of affecting other parts.

For all their simplicity, this spaciousness and room-to-breathe
was something desirable that was lost with the demise
of valve ("tube" to the Yanks) rigs.

=================================
Just for information :
A modular approach to homebrewing (call it biscuit building) is also
very well propagated in the book : Experimental Methods in RF Design ,by
W7ZOI , KK7B and W7PUA.   Most modules are built in 'ugly contruction'
style for best possible (RF) stability and low cost .

Really Gareth, I think this is something you should get going.
Prove your idea is a "goer" and I'm sure others will join in.

Good luck with it.

I look forward to seeing the implementation of the design of the first
unit ever to incorporate the Big-K approach to DSP.

To be fair, I'd like to see some of his projects published and will even offer to host them on a website- with full credit for their design etc. attributed to Gareth.

Quite so. It's just going to be interesting seeing how certain topics
he's posted on in the past turn out in reality.

A cynic might say that by involving others in the design, the
fall-guys are already being lined up ready for any failure that might
arise.

Well, if he comes up with some designs he is vindicated. If the biscuits
turn out to never to be at least half baked then you are vindicated.

He has suggested the idea, I've supported it and offered to host the designs
the ball is now in his court.

Well, I still recall the FT-707 that was bought in order to implement
a DSP CW transceiver for 136 kHz.

It fell at the first hurdle as it wouldn't work on CW.

Despite receiving helpful suggestions via this medium, Gareth never
saw them due to 'an ISP failure'; and nothing more has been heard of
the project - at least on here.

One notorious attention seeker has milked the suggestion
for everything he could get out of it, and has offered no
support for the proposal at all, but is claiming that he has.

Not a difficult guess to name the culprit, I think!

Gareth, you must have missed my post that offered to host your designs on a website, with fully credit to you for the idea and your work.

Please, do some of your designs and I will gladly host them until you have your own website. OR, set up your own website and I will ensure that it is circulated to those who may be interested.

Get those biscuits baking!

I've got a few 6AR11's and 6AF11's that I've been meaning to use for
something. The 6AR11 puts two if stages in on bottle. I also have
quite a few 85khz command set IF cans, so that would be nice. The 6AF11
makes a nice dual af stage, plus the extra triode can be used as an agc
amplifier, smeter amp, or bfo tube. I was thinking of making an all
compactron clone of the Drake 2B at one time, using a last if of 85khz
instead of 50khz to make use of the command set coils.
It would use one 6AR11 as the rf / first mixer, and at the IF stage.
A 6D10 could be the vfo, HFO and hfo buffer.   The last mixer would have
been a 6BE6 cause I couldn't think of a compactron for that stage.

Another idea is the one tube regen from 'pop tronics using the 6AF11.

Sorry, I disagree with many of the suggestions being made. Putting a nonlinear device or devices like a zener or a series of diodes across your antenna terminals can produce intermodulation among incoming signals. These will appear at your receiver as hash and spurious signals at various frequencies. When transmitting, they can create harmonics.

The advice I do go along with is to put a resistor or RF choke across the terminals if static is a problem. Either will prevent it. You won't be able to tell any difference between carbon, carbon film, and metal film in just about any RF application -- any are just fine. Don't use a wire wound resistor, however.

I don't see much sense in letting static build up to several tens of volts, then have a neon bulb ignite to discharge it -- with a loud pop you'll hear in your receiver -- down to a slightly lower level. A resistor or RF choke will keep it at near zero. By all means, have fun impressing your friends with blinking NE-2s, but use something else to drain off the static.

Back in the good old days of CB, in Chicago, I had a ground plane antenna which had no DC return path. My Lafayette CB radio started making some very strange noises so I disconnected the PL259 and was surprised to see a spark jumping across the connecter. This continued for hours as the voltage built up and discharged. Pretty impressive display of precipitation static.

I doubt his sincerity, based on his previous emotional history expressed in this NG, and his contemporaneous linking up with Mrs.Nugatory in an abusive sub-thread.

What you have quoted below is most certainly _NOT_ a support for the proposal. There is no suggestion of what the biscuits might be; no suggestion of what the standard interfaces between biscuits might be; no suggestion of what the mechanical arrangements migth be; no proposals of component sets.

In fact, there has been _NO_ support whatsoever for the proposal that _WE_ all act together to save Ham Radio from the predations of the RSCB and other destructive influences.

What has there been?

Why, merely an examination of means whereby the proposer himself might gain some attention and reflected glory from the actions of others and to set in place, perhaps, the groundwork for a campaign of further abuse, as is his wont.

Web-sites? SPRAT? This is merely stating the bleeding obvious and as a claim for having supported the proposal it is _NUGATORY_ in the extreme.

I thought this was *YOUR* proposal Gareth?

Are you saying that you had this flash of inspiration, but that it's
somebody else's job (the RSGB's?) to do all the work?

Mrs. Nugatory's lashing out in an infantile temper
tantrum now that she has been bested!

Any doubts that she's an anonymous cowardly poison-pen?

None, I think.

Now, Mrs. Nugatory, instead of displaying negative and
destructive tirades against me, why not discuss some of your
own projects and project ideas over the years? It is of course
extremely easy, some might say cowardly, to pick on someone
who has discussed ideas and possibilities over the years in an
attempt to promote the _REAL_ in _REAL_ Ham Radio, and
this picking-on is what you do. However, I think it more appropriate in a NG
for us all to contribute positively to promote the technical pursuit.

Go on! Dry your tears" You _CAN_ be a grown-up if you really try!

Any others got a thought on this , i have no test gear at all and
before i start i was wondering wether it was worth starting at all , but
if i make a LC parallel resonant trap for say the 40m band , if i
soldered a small 50hm dummy load on one side and then fed the trap on
the other through a vswr meter with very small power could the the trap
point be measured or would the loading of the dummy load pull the
resonance off as i aware there be thousand ohms or so imp there , to
save a waste of time no suggestions to make a coaxial trap i not
interested ...cheers paul...

I've never written a follow-up to a Lewallen post, but here is
another advantage to using resistors that Roy didn't mention:

If you put your resistor(s) at an OUTside grounding point and
if you can remember their value(s), you may be able to make a
quick test of the integrity of your feedline from INside the
shack with an ohm-meter! (But NOT during a storm, of course!-)

```
Roy Lewallen <w7el@eznec.com> writes:

Well Gareth, the idea was yours and I was rather hoping you'd supply, at
some point, those details.

> In fact, there has been _NO_ support whatsoever for the
> proposal that _WE_ all act together to save Ham Radio
> from the predations of the RSCB and other destructive influences.

Not really, if you'd prefer to "do" your own website, please do. I'll just
promote you work via a link etc.   I read SPRAT and will happily buy PW if
you get published there.

> perhaps, the
> groundwork for a campaign of further abuse, as is his wont.

How does that work then? All I'm suggesting is support for your idea- which
I really do think is a good one. I'm happy to promote it but you will need
some more " flesh on the bones". Now, if you idea doesn't take off because
you don't publish your ideas, whose fault it that?

> Web-sites? SPRAT? This is merely stating the bleeding
> obvious and as a claim for having supported the proposal
> it is _NUGATORY_ in the extreme.

Well, so far we've had the initial idea (which is a good one), an offer of
some "promotion", and little else from you. I'd hate to see this idea die
so common on, where is your material?

You're missing the point of my suggestion, and no doubt
being deliberately perverse, which was that we should
all act together in such a scheme to counteract the
damage that the RSCB is doing.

The first move for a joint approach is to canvass for
support.

Interesting that you of all people should be trying to
make it seem that you are supporting this campaign against
the RSCB, is it not?

And I've done a bit, maybe you can now do a bit. I admit no one else seems to be rushing to help but, unless they see some progress, they will think your intentions are less than genuine. The best way to tackle this is for your to provide some more "flesh on the bones".

>
> The first move for a joint approach is to canvass for
> support.

No one else seems to be rushing to help but, unless they see some progress, they will think your intention isn't genuine. Conversely, if you provide some more "flesh on the bones", then people are more likely to support the project.

> Interesting that you of all people should be trying to
> make it seem that you are supporting this campaign against
> the RSCB, is it not?

Who are the RSCB? I don't see this "campaign" as being against anyone. I do see your idea as a vehicle to promote home construction etc. so I am happy to support it.

So, where are those ideas? If you'd rather I didn't promote your work via my

website just say so and "do your own thing". However, having sown the idea,
you need to build on it ASAP- otherwise some might think your intentions are
less than genuine.

A couple of points should be made here:

1. There is no such thing as the RSCB.

2. In your original post, you said "Might we all act together to produce
a series of "biscuits" that could then be assembled Lego-like fashion to
produce any rig or test equipment?". This appears to be an admirable
suggestion to help newcomers to electronics and amateur radio, not a
call to arms against a non-existent organisation called the RSCB.

3. You seem to come up with many questions in this newsgroup but sadly
never seem to follow on with helpful solutions. It would be extremely
helpful if you did, so please do as I would be very interested.

Thank you Mr. Evans.

Right. So far, I am looking at the 40th ed (1963), as it has several
good tube projects.

My 'old' ARRL Handbooks are the 1936, 1947 and 1963 editions. I am
still looking for an inexpensive mid-fifties edition. Having one
edition from each decade seems to make the most sense as they do not
radically change from year to year.

The Return of The Harry Thomas Show

The "garage talk show" that is reaching out to Worldwide Usenet

after hiatus he is back to inform the people of deception and corruption.

Hosted by Harry Thomas;

The Harry Thomas Show - week in review is a 4 segment show. We have had

tremendous response and we want to thank our Listeners.

Keep them e-mails coming and thanks for your support !

harrythomas@netzero.net

The Show is recorded on Wednesdays
Posted to usenet on Wednesday Nights to;

Dear all,

I am new to DDS AD9854 and was wondering if you can help me with a specific problem not directly solvable.

My main aim is to generate a simple chirp signal which should be Phase-Coherent. The standard output is Phase-Continuous. Does anyone have any suggestions how to do it ?

Many Thanks.

I'd appreciate any recommendations for an inexpensive Smith chart based program which can be used for the design of basic matching networks and the like. I'm looking for something along the line of MicroSmith or WinSMITH, neither of which is any longer available.

Thanks,
Roy Lewallen, W7EL

> Hello all,
> I have discovered how much fun tubes can be, and am in the process of planning one or more transmitters to go along with my 2-tube regenerative receiver. Now, I'm only 23 years old, so I'm in the process of researching hollow state technology. Could you please put together a short list of the "best" ARRL handbook editions? I have 99 and 05- I'm just looking for a few years to watch for on amazon, etc. Of course, recommendations for other books would be appreciated, too, but I'm on a tight budget...
>
> Thank you very much in advance for your advice.

> Ross, NS7F
>

I am 63, and retired, and am also having a ball building my own tube gear.

Generally, solid state began to take over all the low level circuitry in the ARRL handbooks in the 1960s and particularly afterwards. There was a blend (between tube and solid state) at some interval but I don't look at the later handbooks at all any more. My handbooks are from early 1960s and go back.

The "Radio Handbook" by Bill Orr, also has editions going back, annually or almost annually, for a long time and has a different flavor but also good, and alternative presentations including very nice schematics and photos. The Radio Society of Great Britain (I think) also sponsored ham radio handbooks but I think may also be geared to European tube types which are different (at least to some degree) than US "valves" (as they call them), but you might try to do some research on that.

You might want to think about the tube evolutions: the very early tubes are harder to find and more expensive and particularly the tube sockets.

Around the 1940s we had mostly octal base (key plus 8 pins) and they are easy to find from tube supliers, but many were metal (not good if you like to see those filaments light up). If you like battery filament types (1.4 v for single C cell, 2.0 v for lead-acid cells, and 2.8 v, for two C cells in series) you have a small variety of nice 7 pin tubes (eg. 1T4, 1U4, etc), and a few 8 pin octal tubes (eg. 1A7, 1H4, etc). Prior tubes had poorer specs and the sockets are hard to find. The so-called Loctal tubes (very thin pins and special 'click in' keys)..you just about can't find sockets for and they would be the hardest to build homemade sockets for, and, they themselves are not easy to find, either (I think they were mostly for car radios). Most of these tubes will run plate voltages on a handful of 9 volt batteries you can get at Dollar Tree for two for a buck, and you hook them in series with each other since the connectors are all male-female and otherwise don't need much to hold them together if you just lay them on the table and hook aligator clips to the terminal negative and terminal positive. A lot of the earlier tubes have difficult to find sockets (but Radio-Daze, in New York, has a lot of sockets).

Public libraries can be a resource but be aware that most smaller ones "discard" their older holdings and replace them with newer versions. Your best bet is to ask at the reference desk to find out how you can find which library has the older editions. The _central_ or _main_ branch (in your state) may be the only one that keeps older editions but you should be able to arrange an inter-library loan where you can borrow the book for, say, two weeks, and then if you like it, look for a copy on Amazon.com or www.addall.com or www.bookfinder.com or www.abe.com or www.alibris.com where you will find used copies at generally very reasonable prices. To find booksales where used books are very cheap, go to: www.booksalefinder.com

Good luck.

Thanks for the suggestions, but I see I need to be more specific about what I need.

I'm looking for a Windows-based program that runs on a local machine rather than remotely as at a web site. The objective is to find a program for EZNEC to write input files for, so that its frequency sweep impedance data can be easily and directly imported into the Smith chart program for visual analysis and to aid in designing narrow and broadband matching networks for antennas. EZNEC originally did this for MicroSmith, then WinSMITH input file writing was added when MicroSmith became unavailable. Now WinSMITH is also unavailable, so I'm looking for another one which I can adapt EZNEC to.

Hi Roy,

Darn, sorry that WinSMITH is no longer available. Hope you'll
continue to support that format for those of us with that program.
Based on what I just found, I don't have any reason to quit using it.

You might try LLSmith from http://tools.rfdude.com/RFdude_Smith_Chart_Program/
RFdude_smith_chart_program.html.
I don't like it as much as WinSMITH, but it looks like it does
somewhat similar things. I found it via a Google search, which led me
among other places to http://www.sss-mag.com/smith.html and
http://www.circuitsage.com/matching.html. The latter one provided the
link to LLSmith. I think I have a useable version of Motorola's Smith
chart program somewhere, but the version I just downloaded is pure
garbage from my point of view; it may work but it's so awkward that
it's worthless to me.

Cheers,
Tom

Thanks, I'll look those up. Negative recommendations are as useful as positive ones, so thanks for those too.

Don't worry, EZNEC will continue to write your choice of either MicroSmith or WinSMITH files as well as whatever program I choose for their successor.

Additional comment: if you write impedance files in standard network
analyzer format, they can be used by a lot of programs. I believe you
can find fairly detailed descriptions of the .s1p format on the web.
In particular, RFSim99 can read such files and use them in a 1-port
representation. It will even do an automatic L match to an impedance,
and will display S11 on a Smith chart. (But I'm remembering a problem
if you write them in dB format, something about that RFSim99 uses
10^(dB/10) instead of 10^(dB/20) to convert them to linear before it
uses them...)

Cheers,
Tom

OK, I gotta quit looking at Smith chart stuff...

Are you sure WinSMITH is no longer available? See http://www.scitechpub.com/WinSmith.htm.
Looks pretty current to me. My 2.0 version was provided on floppy,
and I see they've gotten into the 21st century and have it on CD-ROM.

Cheers,
Tom

Hi Roy,

There is a very slick one Switzerland:
http://www.fritz.dellsperger.net/downloads.htm
from Dr. Fritz Dellsperger.

It, like your software, has a free but limited use. Getting the full
use one is rather more obscure as there is nothing mentioned at his
site as how to get a key or otherwise obtain full use (more than a
limited number of points). Somewhere, there was the suggestion of
accommodating a user if they emailed, but that never worked for me.

73's

Somebody tell Roy that Robert Lay, W9DMK, has a
SMARTSMITH program that may or may not be what
he is looking for and may or may not be
EZNEC compatible.

Anyone have an electronic copy of a manual for the Iwatsu SS-5710
O'Scope?
Just started homebrewing this year (finally) and got me a pretty
decent scope but need a manual.

Thanks.

I just want to say that if you want to build your own tube gear, you
should look seriously at compactrons.  Designed for consumer electronics
use, they have some excellent specifications and a lot of elements in
a package.  And they are absolutely dirt cheap because there is no demand
for them on the surplus market at all.

Some of these things are absolutely wonderful performers and available
free for the asking.  12 pins good!

Hi everyone,

I have a small question about PSPICE. I'm using PSPICE to simulate a colpitts oscillator, and want to know the resonant frequency of the circuit. What should I do to set up the simulation condition? I used the transient simulation and FFT hoping to find the spectrum figure, but it seems if I change the time step the spectrum also changes??? What should I do now? I'll appreciate any of your help!

Jessie

In a old Radio Amatuer's Handbook there was a circuit of a single transistor using a ferrite core transformer to get a broadband fixed gain of 6db or so for an antenna line amp. I've lost the Handbook.
Can anyone find it or equivalent and send the info?
Thanks Mr C

At resonance, the phase shift through the circuit is zero. Break the loop where it connects to the input of the active device and put a low level source at the input of the active device in place of the loop connection. Do a frequency sweep, plotting phase, and find the frequency where the phase angle at the top of the tank is equal to the phase angle at the capacitor tap. You should be able to do this with a single plot of the phase angle difference.

This is close to the frequency at which the circuit will oscillate. It'll oscillate where the total phase shift around the loop, which is the sum of the shift through the tank and the shift through the active device, is zero.

I haven't used PSPICE for several years and am unacquainted
with newer versions, preferring the LTSpice free package
available from Linear Technology Corporation. Both use the
same SPICE core routines-algorithms so it all depends on
how the variants "wrap" the core routines for human interfaces.

None of the SPICE variants can yield an "exact" frequency
of oscillation...but you can come close to that depending on
how many thousands of repetitive cycles it allows in memory
and the available memory of your computer. [I would carefully
check the PSPICE manual for conditions necessary with
their "wrapper" controls]

With LTSpice I've not had a problem with oscillator circuit
simulation start-up...not with starting at t=0 or delayed.
For example, a 10 MHz crystal oscillator simulation might
take 50 mSec or thereabouts to reach a stable oscillatory

condition so one can't expect to see a sinusoid oscillation very near 0 time. With L-C tuned oscillators the start-up time is sooner than that due to lower Q of L-C versus a simulated quartz crystal.

One of the difficult tasks in designing an oscillator circuit ON Spice (as opposed to beginning on paper) is obtaining proper feedback and the limiting conditions of voltage-current swings. There isn't any "easy" answer for that. An integrated schematic-net-list function (as in LTSpice) makes it easy to twiddle values to get one going. More twiddling with values gives one a "feel" for getting the right mix of parts values. My suggestion is to do that twiddling of values until oscillation is established and seems stable enough with supply voltage variations. Once there the measurement procedure for actual oscillation frequency would be rote work of counting of oscillation cycles and their slight phase shifts over the time intervals. The first step is insuring there IS an oscillation happening.

In the beginning of SPICE (core entirely free from Berkeley) it was a #$%^!!! job to introduce some kind of momentary transient (or "noise") to disturb the simulation model ("shock" it gently if you will) to begin oscillation. Most variants no longer need that since their "wrappers" have been modified to handle it.

The only question on various SPICE packages is their numerical accuracy in regards to frequency of oscillation. Few packages will say that directly. At minimum the simulation calculations would be done with "single precision" equivalent to 7 decimal digit calculation accuracy. Most seem to use "double precision" or 14 decimal digit equivalents so the simulated oscillation frequency could be close to 1 part per million for a very large circuit model (worst case with all errors adding up the same worst way).

MOST IMPORTANT of all is the simulation model and its components, including the stray/parasitic parts of each passive component as well as an accurate model of the active parts (transistor, diode, or vacuum tube). Most SPICE variants have a large active component library and those are quite accurate to nominal operation of the real parts. Failure to model the circuit correctly will result in failed results...one just can't cobble together some parts as on the bench and get some kind of action going.

OK, now that I've done the "spanking" [:-)] about basics, it's time to get the model working. Once that is done, the niceties of checking the harmonics is one of the last jobs. The FFT check on harmonics in PSPICE is probably different from LTSpice because the FFT routines are in the "wrapper" of the SPICE routine's core. Those vary depending on the variants program build.

Good luck on your model.

73, Len AF6AY

Hello all,
I am just starting to get myself into Ham Radio. I am finding studying Morse very hard, but I really want the general license, so I'm sticking to it.

My questions to you guys today regard antennas. I would like to have some antennas mounted on my house roof. I live in North Vancouver, BC, Canada, if that helps any in giving suggestions. I am curious about what antenna is used for which frequency. I would like to be able to transmit on the HF and VHF bands. Apparently there is something about a 10-meter band, a 15-meter band, etc. Why are they called meter bands? Is that like an electric "meter" or something, or is that like the "metre" unit of distance measurement? If it is the metre of distance, do the numbers represent how high the antenna has to be, or how long, or what? There is no way I can have a 60 metre antenna on my roof! Perhaps they could be coiled up or something? Can one antenna transmit on a broad range of frequencies? How much should I expect to pay?

Second question, with hand held 2-way radios, in North Vancouver, the range is limited because of the hilliness. I literally live on a mountain, and there are forests and valleys everywhere. My house is on a bit of a hill, and standing on my balcony I can receive and transmit very well over a good range (2-3 miles). On ground level in the same home I can get 1 mile at most. In the basement I can get 0.5 miles. What I want to do is to stick my antenna (from the BPR-40, Mag One by Motorola) up high on my house, and then transfer the signal, via wire, down to my room or even the basement. The threading seems pretty standard on the radio, but is doing this possible? Would it screw up the "meter" of the antenna? How could I transfer the signal without messing up the "meter"? I would like to transfer the signal a minimum of 50 feet.

Thanks,

fogus

Good idea Tom. Roy: Besides RFSim99, Agilent's free AppCAD program has a mode where it can overlay a set of data on a Smith chart, having read it from the Touchstone ("standard network analyzer format") files.

Well, I'm already committed to 7 & 9 pin miniatures, and 8 pin octals,
have plenty of sockets, and more than enough tubes for my lifetime.

Once, long ago, I had a filament battery portable AM radio. About half the
size of a cigar box. Four tubes, one D cell, one 90 v B battery, and lift

up the cover, and it goes on in about 1/2 second, and sounded good. If I
have time, I'd like to build that (if I can't find a replica, or a similar
set [I think the old Zenith trans-oceanic had battery filament tubes, too,
might be interested in one of those instead]). Just for nostalgia.

RE: METERS
The term "wavelength" is left over from the early days of radio. Back then, frequencies were measured in terms of the distance between the peaks of two consecutive cycles of a radio wave instead of the number of cycles per second. Even though radio waves are invisible, there is a measurable distance between the cycles of electromagnetic fields making up a radio wave. The distance between the peaks of two consecutive cycles is measured in meters. The relationship between a radio signal's frequency and its wavelength in meters can be found by the following formula:

wavelength = 300 / frequency in MHz

Certain segments of the shortwave bands are referred to in terms of "meter bands" as a convenient form of shorthand. For example, the term "10-meter band" is used to refer to the ham radio band that extends from 28000 to 29700 kHz.

Muliband antennas are common. For example, the Cushcraft R8 overs 6,10,12,15,17,20,30,40 meters

The GAP Titan DX antenna covers 10m 12m 15m 17m 20m 30m 40m and 100 KHz on 80m Using a tuner and a long wire -- just about all the bands can be covered.

SGC makes a tuner that will cover 1.0 to 60 MHz with antenna lengths of
Minimum lengths: 8 feet(3.3 to 60 MHz)
23 feet(1.0 to 60 MHz)

For your VHF antenna use low loss coax (50 Ohm) rated low loss at the frequency you are operating at.

P.S. A long transmission line "does not mess up the meter" as you wrote.

I have run 100 feet of coax in an installation without a problem

Hope this helps

Good Luck

Lamont

Hey, thanks Lamont! That helps a lot. Wavelength being the meters, the number 300 coming from the speed of light in thousands of kilometers (right?).

Just one question though: When I look at my walki-talki's antenna, when I unscrew it, there is just a single threaded piece of metal, not two cables. Correct me if I'm wrong, but wouldn't attaching a cable to this threaded piece of metal change its receiving and transmitting characteristics? What is behind this antenna plastic in my hand held? A spring like structure? Doesn't the antenna need to push and pull the electrons? How can it do that if there is only an entrance? I'm kind of confused about this antenna design stuff. Is there a paper online where I can read about it?

Are you saying that if I bought a spare antenna for my radio, put it above my house, and ran a single wire (within the coax shieldings, of course, but essentially a single conductor) to my radio, that it would work, perhaps even better than inside my basement? That would be great.

Wouldent there be a major hurdle in setting up a repeater station, if there were only one between two radios? I thought a repeater had to receive on a different frequancy than it transmitted on.

Thanks for those model numbers, BTW, that helps emensly. Would those work attached to a hand held, or would I need an appropriately powered transmitter? I will look those up soon.

Sorry, that was actually a lot of questions.
thanks again
fogus

Without knowing what Handie Talkie you are using, but in general you need an
adapter from the HT that mates with 50 -ohm coax. Your local Ham dealer
should have the adapter. My guess it would be an SMA to SO-239 adapter.

See URL:
http://cgi.ebay.com/SMA-Male-to-UHF-Female-SO-239-Adapter-1-Shipping_W0QQitemZ220081794583QQcmdZViewItem

> great.

No you need both the center conductor of the coax and the shield to connect
to the radio.
>
> Wouldent there be a major hurdle in setting up a repeater station, if
> there were only one between two radios? I thought a repeater had to
> receive on a different frequancy than it transmitted on.

A repeater does operate on two different frequencies, but the key to a

repeater is a duplexer operating into a single antenna -- see repeater block diagram at URL:
http://www.hamuniverse.com/repeater.html

Not a simple matter however, a repeater needs a controller, timer, IDer and quite a bit more. And they are expensive to buy or build.

>
> Thanks for those model numbers, BTW, that helps emensly. Would those

Well most handhelds are VHF/UHF only. When you are talking about 160M thru 10M, a different radio is needed -- maybe like the Yaesu FT-817ND
URL:
http://www.universal-radio.com/catalog/hamhf/1817.html
>
> Sorry, that was actually a lot of questions.
> thanks again
> fogus

Do you have a Ham Store nearby - take in your HT and see what they recommend.

Lamont

ANNOUNCEMENT : New and Improved Sound now posted in mp3 Format

The Return of The Harry Thomas Show

The "garage talk show" that is reaching out to Worldwide Usenet

after hiatus he is back to inform the people of deception and corruption.

Hosted by Harry Thomas;

The Harry Thomas Show - week in review is a 4 segment show. We have had

tremendous response and we want to thank our Listeners.

Keep them e-mails coming and thanks for your support !

harrythomas@netzero.net

The Show is recorded on Wednesdays
Posted to usenet on Wednesday Nights to;
alt.binaries.great , - alt.binaries.radio.misc , -
alt.binaries.multimedia.documentary -alt.binaries.sounds.radio.misc, -
alt.binaries.sounds.radio, - alt.binaries.sounds.wma, - and
alt.binaries.multimedia - alt.binaries.mp3
The NFO (information) file posted both days to ;

alt.pirate.radio, - alt.internet.talk.radio, - alt.talk.radio, -
rec.radio.amateur.homebrew, - rec.radio.misc, -

I'd suggest an MK484-style MW receiver that feeds a simple common base VCO like your average "FM Bug" circuit. Needs only a slack handful of components, fits in a matchbox and would run from a pair of AA cells for days.

Greetings:

It seems that published links to the Sanyo LA1205 IF block
IC datasheet are dead; I am modifying a receiver to
use a different mcu, improve the PLL loop, etc.
and would dearly appreciate a copy of the LA1205
datasheet.

Regards,

Michael

What chip did you use? A Vishay TFDT4500 or something like this? The data sheet would suggest what you indicated about 4 or 5 components needed. Other than that, Maxim and Microchip parts would require more work and parts.....what other options?

Thanks
Jim

Both seem to work for me,although one is more of a "spec sheet" and the
other is in Chinese/Japanese -but the schematics are in engrish. :-)

Thanks!  Perhaps I can convince a Japanese reader to translate the text ;)

I didn't find these in my searches; I had a number of dead links from
other websites and Google produced dead links to Chinese IC info sites.
Alldatasheets.com also didn't have them and I have avoided other
datasheet sites since most have gone to paid subscriptions.

The schematics appear to involve reference designs that I've seen
in some of the products which used this device; the text surely includes
important design and parametric information and deserves translation.

If anyone has the English text version please let me know.

Regards,

Michael

IIRC the one I made connected to the serial port,and was nothing more
than an IR reciever,and an infrared LED..couple resistors,and a Diode
and small cap,or something like that...no chips needed.
Connection to the parallel port might require some more 'trickery'.

Saturday I found an electronics kit at a yard sale I was an unassembled all in the box AA5 receiver. Looks lie it is some kind of educationa kit. It was all in the box but it did not include the cabinet just the chassis and parts. I was thinking of assembly it on a larger chassis and then begin making mods on it. I am thinking more IF stages, mechanical or xtal filter, xternal VFO(my sig gen) BFO any other ideas on what you could do with one of these.Of course adding a transformer.

Anyway you can do 5wpm is a good way. Once you get on the air it will
improve though you may find you are re-learning it every time you make a
significant speed increase but you will get there.

Jimmie.

I tried one for a 4cx250 amp, sucked bilge water big time. I dont think the
primary had 100 turns on it.

I wonder if we who are the Usenet-frequenting Radio
Hams might somehow get together to sort out the
dreadful mess that has been created in no small
part by the self-interest of those who control
the RSCB?

Might we all act together to produce a series
of "biscuits" that could then be assembled
Lego-like fashion to produce any rig or test
equipment? This would have a number of benefits,
not the least of which would be the bankrupting
of the cancerous emporia whose off-the-shelf
Cheque-Book (CB) radios are not only discouraging
the homebrew engineering that is the essence
of _REAL_ Ham Radio but also encouraging an
altogether undesirable element to regard
themselves as of our ranks. Once the advertising
income from those dead emporia ceased to flow,
then the national societies might get back
to supporting technical excellence instead
of Complete Bullshit (CB) as they do now?

(And, no, I'm not thinking in terms of the facile
hardware exercises that bring on the disease known
as the gangrenous degeneration that is the M3/CB
Fools' Licence scheme; facile because once a
so-called "licence" has been granted the hardware
diversion is largely forgotten.)

Like LEGO? Well done for realising that currently amateur radio has
done little to interest the under-fives. Maybe it's a whole new market?

FWIW (pardon me) but I recognize what you are talking about as "descrete
```

devices" (i.e. tubes, transistors, resistors, capacitors, etc.).

  This would have a number of benefits,
> not the least of which would be the bankrupting
> of the cancerous emporia whose off-the-shelf

I think all that store-bought stuff just dumbs-down the brains of people who would be better off building their own, leanring something, and sharpening their wits in the process.

  Once the advertising
> income from those dead emporia ceased to flow,
> then the national societies might get back

> of Complete Bullshit (CB)

Hey, that's a great acronym for CB (or vice versa)!

  as they do now?

Well, you should be able to get the RSGB for about a fiver, so maybe=20
worth a punt :)

--=20
ARRL membership =3D $39 (~=A320)
RSGB membership =3D =A344

Don't let them rip you off any more.
Do the right thing, resign from the RSGB today.

The RSGB said Radio Amateurs were a threat to national security!
Is this the type of organisation you want to represent you?

that was the first idea that came to my mind. You certainly
have a few options for impedance transformations!

There is more than one way to skin a cat. The 811A is a high mu triode.
There are several ways to create such a beast.

One: place the grid closer to the cathode than to the plate. The ratio
of the distance between grid and cathode vs the distance between cathode
and plate is one of the factors that determine the mu of a triode.

Two: construct the grid with close spaced turns. The closer the turns
of the grid wires are to each other, the higher the mu.

Three: Use two concentric grids. This is very similar to number two.

>

ANY triode works well in grounded grid. A high mu triode will have
better screening due to the close wound grid. Tetrodes such as the
4-400 have been used in grounded grid by grounding both grids. Others
such as the 4cx250 don't have enough heavy enough grids to handle the
current in class AB2 or B so they are run in cathode driven service with
normal grid and screen voltages, but with both grid and screen grounded
for RF.

Hear hear, Walt! (pun intended too)

I occasionally read notes from some Hams writing about the "empty bands". I suspect that they mustn't have much in the way of an antenna. ;^)

Perhaps that is okay though, as there appears to be some kind of correlation between those Hams who can't put up a good antenna, and a poisonous attitude.

> The fact that the amateur radio population is ageing has actually

> disposable income and plenty of time on their hands.

The demographics have changed. The idea of the Ham who has been licensed since they were 7 years old and has been in the hobby for 50 years is gone - and there weren't that many of them to begin with.

What we have now is the Ham who waited till their children were out of the house, or the Ham who decided to get their license after retirement. I got my license at 45. Big deal. What is needed is enthusiastic NEW Hams. And you can be any age for that.

And yeah, I love Homebrewing. Our club is holding classes in basic homebrewing to see how many of the newbies we can infect with SSA (solder smoke addiction) ;^)

That's one good reason, but don't forget those Hams who are tired and bitter and just want to complain.

Especially the ones who can't put up a decent antenna, and think the lack of signals means that no one is on the air! ;^)

What do you do for resistors if you can't get carbon composition in the ratings you need? I built a MFJ-1020A out of surplus and scrap before realizing that the metal film resistors I was using had inductive reactance when used in an RF circuit. My local parts depot mostly just has metal film resistors, not the carbon composition devices I need. Seems I heard somewhere that there is such a thing as non-inductive metal film, but if there is, how do I find it? Otherwise, where can I get carbon composition resistors these days?

Any help would be appreciated. My home-built active antenna (for shortwave) puts out such a terrible signal it is virtually useless.

Thanks,

Dave (an RF newbie)

I can't imagine that the resistors have enough inductance to
make any difference at HF. Plus, the reactive component
is in series with the resistance, which would increase the
impedance of the resistance slightly--in most cases that
would be more of a benefit than a hinderance; since I'd
bet most of the resistors are being used for biasing active
components, or to provide signal isolation..

Does anyone have any evidence that it makes a hill of
beans difference at HF?

Pete

Lots of stuff that works should be ample evidence.

There are some numbers in Experimental Methods for
RF Design that suggest such resisters are fine to low UHF.
It's really a non-issue.

Do what the professionals do - use film resistors. Concerns about inductive effect at HF are greatly exaggerated. There are rarely as many "turns" as often suggested. (cf. Radcom Jan 2007, p58, fig 1!)

>where can I get carbon composition resistors these days?

They are still available. Typically, Farnell offer 220R to 4K7 at 1W - but they are quite expensive.

And obsolete, because for every application there is now a better
alternative -  most often, metal film.

Hmmm.  Okay, well, could the problem be the monolithic ceramic caps I used?
Something is creating a boatload of harmonics, and that's the only other
component besides the transistors themselves.

Thanks much for the input...

Dave

Hi Dave,
This post mentions something that I did not perceive from your first post. You mention a 'boatload of harmonics". As I understand it, the MFJ-1020A is an active antenna circuit, but I don't have any details.
How are you noticing these "harmonics"? If you are hearing them from the receiver this circuit is feeding, my guess is that either the active antenna or the receiver front end is being overloaded and driven into non-linearity.
I would suspect the active antenna.
Can you provide more information? Where are you located, urban or rural?
What kind of system is this circuit a part of?

Bob

Hey Bob,

I am feeding a signal from my RF signal generator to the circuit on my workbench. I mention harmonics because the sinewave goes from nice and clean to "blurry" and looking "smeared" across the screen of my O-scope. I may *be* overloading it, but I thought that would result in clipping of the waveform. I have the signal generator set to attenuate the signal severely, and *thought* that would prevent overloading. Maybe not...

Back to work on it some more, and try to make sure I am not overloading the device.

Thanks,

Dave

Hi again Dave,
It is also possible that the circuit is oscillating. I have seen amps are ok with no input signal but will break into oscillation when a certain freq/amplitude input signal is applied (and vice versa). How did you build this thing? Circuit board, protoboard, dead bug.....???

Bob

Hey Bob, thanks for your interest.

I built it on a piece of perfboard with point to point wiring, clustering the active components and their biasing resistors fairly closely. I don't *think* it is oscillating, although to wouldn't swear to anything just now.

I have the signal attenuated as much as possible, to the point where it doesn't even cause a wiggle on the scope with my X10 probes and the scope set to 50mV/div. With the tuner set to resonate, it shows up as about 30 or 35 mV (5 MHz) going into the circuit. The output is 70 or 80 mV, but it is "blurred" and "smeared" as I described. Also, I just realized that the scope shows *2* traces, each identicle to the other (only using one channel, and one scope probe.) I can upload pictures of all this if desired, probably to alt.binaries.schematics.electronic. Don't know how else to describe what I am seeing. How could one signal become two traces, each identicle to the other?

Thanks much,

Dave

Wrong resistor value = bad biasing = harmonics? Just a S.W.A.G?

Hello Ian,

I don't get a chance to read Radio Communications often and didn't see your article. As a professional in the design end, I'll offer a few comments:

There is still (needless) confusion in amateurism as to metal film resistors' "inductance" in comparison to wire-wound resistors which DO have considerable self-inductance.

While there IS some self-inductance in metal film resistors (due to laser-trimming and patterns of film on the usually ceramic substrate), it is difficult as @#$%!!! to measure and easier (but still grudge work) to model as a conductive strip spiral-wound on the same physical dimensions. For nearly all amateur applications up to and including 6m, that won't be noticeable. With some caveats, of course.

Self-inductance of metal-film resistors will vary depending on the manufacturer and their methods. So will construction which adds varying self-capacitance from the end-caps (metal) holding the wire leads. Self-capacitance is easier to measure on a Q-Meter but is seldom over a half a pFd. That results in an equivalent of a resistor in series with self-inductance, the whole in parallel with self-capacitance. The effect on a circuit depends on WHERE it is placed in the circuit. I've found that carbon-composition resistors - in general - have a slightly higher self-capacitance...but that depends on who made them and what internal structures were involved (has to be broken and observed if no X-Ray machine is handy).

As a dummy load consisting of many smaller resistors in series-parallel, one can estimate the total capacitance and inductance based on individual resistor models arranged in whatever combination is planned. Offhand, I'd say that rarely does that affect the dummy load's VSWR beyond 1.3 at 6m. In arranging a series-parallel combination, there will probably be more effect from whatever conductors' shape are in doing the interconnects...less so if on a PCB, probably more if by wires. A good rule-of-thumb is simply "make all connections as short as possible, consistent with allowing air flow to dissipate heat."

The only place to get paranoid about effects of self-inductance and self-capacitance is in metrology. Metrology NEEDS to have a minimum of each and to have accurate resistance values at the rated frequencies. Everyday dummy loads for amateur radio are far from lab-quality metrological stuff and don't need to be in that precision range.

73, Len AF6AY

A picture would help. This sounds to me like it _could_ be just the scope. Seeing two traces (obviously not really identical or they would look like a single trace...maybe you're seeing two copies of the same thing, one shifted in time from the other?) tells me that the scope may be triggering or syncing twice per cycle. What kind of scope? Do you have full control over the triggering? If so, try varying the trigger level.

If you see a sine wave that's clipped (flat-topped) on the top and/or bottom, that's an overload of the active devices in the circuit, assuming you fed your circuit a good sinewave to begin with. If you see a trace that is widened out, it may well be oscillations on top of your desired signal.

There are lots of things you can do to determine what the problem really is. I'd guess it's unlikely that it's the resistors. I've used 2W metal-oxide spiral film resistors out to 450MHz for a dummy load, and the load had a very low reflection coefficient out to 2 meters, and quite usable at 450MHz, per an HP network analyzer.

In fact, carbon composition may NOT actually be better! They may show less inductance, but greater variation in resistance, than film-type.

In addition, if the resistors are used to bias transistors, and not as RF loads, a little self-inductance is not necessarily a bad thing. At first I thought your circuit was an RF bridge or some such, but apparently that's not the case. I do think you've barked up the wrong tree, and just need to find the right one. Leave no tree unbarked??

Cheers,
Tom

Hey Tom,

I'll try to upload a jpeg of the scope trace, and possibly the schematic and setup producing it. Would love to solve this mystery. There was a time when I had this active antenna working wonderfully. Now it's not much use, and I can't figure out why.

Regards,
Dave

Just posted jpegs of the scopetrace/schematic/device under test to
alt.binaries.schematics.electronic. Please let me know if I can provide
anything else for this discussion. Thanks to all...

Dave

I'm off to fiddle with the triggering level, which I meant to do earlier.

Hello Len

I beg your pardon, that was a different article by someone else. The one that I wrote, on the same subject, was in Radcom for July 2005.

Even so, both articles were saying the same thing - and you have written almost exactly the same again below! Nothing uncanny about that, of course: we are all looking at the same resistors, and noticing the same things.

> There is still (needless) confusion in amateurism as to metal film resistors' "inductance" in comparison to wire-wound resistors which DO have considerable self-inductance.
>

It seems to be part of amateur radio's eternal quest to reduce the whole of RF engineering to a series of simple one-liners, like "carbon composition = non-inductive = good" and "spiral = inductive = bad".

The vital part that gets squeezed out is always "by how much"?

> While there IS some self-inductance in metal film resistors (due to laser-trimming and patterns of film on the usually ceramic substrate), it is difficult as @#$%!!! to measure and easier (but still grudge work) to model as a conductive strip spiral-wound on the same physical dimensions.

I was able to make some measurements of (R+jX) using the N2PK VNA, with a test jig made from PC board and copper foil, and some care in the choice of open, short and 50R calibration standards. Sweeping from 60kHz to 60MHz gave almost constant R, and a "good straight line" of X against frequency. This implied that a simple series L-R model would be valid, and that self-capacitance effects were not significant over the measured frequency range.

> For nearly all
> amateur applications up to and including 6m, that won't be
> noticeable. With some caveats, of course.
>

Exactly so.

> Self-inductance of metal-film resistors will vary depending on
> the manufacturer and their methods.

Yes, very much so.

All of these tubular metal film resistors are based on a cylindrical rod of ceramic, with metal end caps connecting to the wire leads. A continuous layer of resistive film is deposited on the surface of the ceramic to form a continuous cylinder. A range of resistance values can then be achieved by cutting away some of the metal film - normally they remove a narrow spiral of material, leaving behind a broad spiral ribbon of film.

The resistance value will depend on the width and the total number of turns in this ribbon. The self-inductance will depend mostly on the number of turns (along with the other body dimensions, of course). When the number of turns gets much above about 10, the ribbon becomes quite narrow, which makes it difficult to keep control over the resistance tolerance. At that point, the manufacturer will switch to a base material of higher resistivity, so the next-higher value of resistor will drop back to having the minimum number of spiral turns; and so the cycle repeats.

This has two important results:

1. Some values of resistor will have significantly more or less inductance than others. All the way up the resistance range, from typically1 ohm to 10Mohm, there will be a series of break-points where the inductance flips between roughly the maximum and minimum possible values.

2. These break-points will vary from one manufacturer to another - for a given standard value of resistance, the inductance could be wildly different (ask Elecraft about that one!)

For 3W resistors using 3-4 spiral turns, I measured about 4nH. This correlated fairly well with the value calculated using the usual inductance formula.

Even in the worst case of about 10 spiral turns, the inductance would only be about 150nH, which is low enough for most RF applications up to 30MHz. For example, in a 50 ohm resistor, 150nH of series inductance would increase the VSWR to about 1.75 at 30MHz.

But that is very much a worst case. If VSWR matters at all, you would use a larger number of higher-value resistors connected in parallel, as Len describes below. This would divide the effect of the inductance by the number of resistors used.

> So will construction which adds varying self-capacitance from the end-caps (metal) holding the wire leads. Self-capacitance is easier to measure on a Q-Meter but is seldom over a half a pFd. That results in an equivalent of a resistor in series with self-inductance, the whole in parallel with self-capacitance. The effect on a circuit depends on WHERE it is placed in the circuit.

And the frequency, of course.

Agreed with everything else too...

> I've found that carbon-composition resistors - in general - have a slightly higher self-capacitance...but that depends on who made them and what internal structures were involved (has to be broken and observed if no X-Ray machine is handy).
>
> As a dummy load consisting of many smaller resistors in series-parallel, one can estimate the total capacitance and inductance based on individual resistor models arranged in whatever combination is planned. Offhand, I'd say that rarely does that affect the dummy load's VSWR beyond 1.3 at 6m. In arranging a series-parallel combination, there will probably be more effect from whatever conductors' shape are in doing the interconnects...less so if on a PCB, probably more if by wires. A good rule-of-thumb is simply "make all connections as short as possible, consistent with allowing air flow to dissipate heat."
>
> The only place to get paranoid about effects of self-inductance and self-capacitance is in metrology. Metrology NEEDS to have a minimum of each and to have accurate resistance values at the rated frequencies. Everyday dummy loads for amateur radio are far from lab-quality metrological stuff and don't need to be in that precision range.

```

I've got, and love, an RFSpace Inc. SDR-IQ software-defined receiver. It covers 100 Hz to 30 MHz, and lets me eyeball any 190 KHz (or narrower) chunk all at once, which is rather particularly nice. I'd like to be able to use it on 30 to 60 MHz and higher, which means that I need a downconverter. It seems to me that a suitable downconverter would let me set a switch to choose which 30 MHz band got mixed down to the roughly 0-30 MHz baseband.

I'd like to have this work up through the 70 cm. ham band for sure, and as much higher as I can get. I know that construction techniques change as one gets above HF, and change _radically_ at UHF and above. How hard is this going to be, overall?

The general setup I envision is something rather like

```
                               LO
                              n*30MHz
(n to                          |
(n+1))                         |
* 30 MHz    30 MHz wide        V        0 to 30 MHz
input --> bandpass filter --> mixer --> output
                                        to SDR-IQ
```

Some questions for the (perhaps not older: I'm 60) wiser heads with

more design-and-construction experience: is this at all a reasonable
thing to do? Does anyone have any ideas on suitable mixers? Am I
looking at a disparate-enough set of frequency bands that I will wind
up having to use multiple mixers, possibly one per 30 MHz band, or
per octave? It is trivially obvious to me that I'll need different
antennas.

Is it reasonable to look at using a comb generator which is driven by
a 30 MHz reference, so that I just take the appropriate harmonic and
amplify it to a power level that suits the mixer I have to use for
that particular 30 MHz band?

All of the discussion about metal film resistors and a pF here or there of
stray capacitance is interesting, but the symptom sounds to me a lot like a
cold solder joint.

Ahh! I was wondering how to break the news to you, Ian!

BTW, I was making a critical reference to that figure in G3LDO's article. It is figures like that that reinforce perceptions of significant inductance in such resistors.

John A

I would like some help in hacking an IR printer adapter made for the HP 350c printer. This is a tiny pc board with a minimum of components connected via 8 wires to a parallel printer connector. I would like to put this to use as a serial port to IRDA device if possible. Yes, I know there are probably simpler ways, but this is a very tiny board, and I'd like to learn from it anyway.

This board is different from others I have torn into. It has an IRDA transmitter/receiver encoder/decoder similar to but a bit smaller than the HSDL7001 but only has the numbers R800 and 016A on the back. This is a through hole, 9 staggered pin device. This adapter was sold by HP so is this R800 an HP part? Wish I had a data sheet!

In addition there is a small crystal with the frequency 3.68 mhz but no processor......but does have 3 transistors, 2 resistors, and 2 capacitors (all surface mount). I think this is the frequency specified for 16xclk.

On the connector side, the only used pins are:

18 +5v
19 gnd
10 low-ack
1   low data strobe
13 high
12 high-paper end
19 gnd

19-31-36 (low) (gnd) are all conncted
11-16 connected (gnd)

The presence of the crystal leads me to believe that the baud rate is taken care of already, on-board. So how do I go about finding where the rx and tx connections should be. Or is this even possible? The circuit is obviosly getting it's power (5v) from the printer.

I have in mind to use this on my Etrex GPS to upload/download info via IR from my computer.

Thanks
Jim

Offhand, NOT hard at all...with the aid of some MiniCircuits
components such as the mixer and perhaps an input low-pass
filters.  The down-converter's LO is going to be the bear
if you want frequency accuracy.

>The general setup I envision is something rather like
>
>                               LO

>input --> bandpass filter --> mixer --> output
>                                        to SDR-IQ

That's the general block diagram of every down-converter.  :-)
With perhaps the exception of the "30 MHz wide BPF."  Nearly all
wideband spectrum analyzers use a lowpass filter there with the
LO riding ABOVE the input frequency; image will be on the "high
side" and that is blocked-out by the LPF.

>Some questions for the (perhaps not older: I'm 60) wiser heads with
>more design-and-construction experience: is this at all a reasonable
>thing to do?

Absoutely reasonable.

>Does anyone have any ideas on suitable mixers?
```

I would suggest going to www.minicircuits.com and seeing what they have...a rather large selection. Those are ready-built in various basings and all cover an octave or more in both input and LO ports. MiniCircuits has some nice tutorials on various aspects of Mixers. Price is reasonable for ready-built components.

>Am I looking at a disparate-enough set of frequency bands that I will wind up having to use multiple mixers, possibly one per 30 MHz band, or per octave?

I would say a single Mixer rated at LF to 1 GHz Input will do the job. Passive (diode) Mixers are as broadband as their coupling transformers and diodes allow, something now quite wide in frequency.

>It is trivially obvious to me that I'll need different antennas.

Not necessarily. A discone can do nearly a double decade in frequency range but at a slight loss (1 db or so) less than a dipole. For more gain and directionality, a log-periodic for VHF-UHF can be used for an easy decade bandwidth.

>Is it reasonable to look at using a comb generator which is driven by a 30 MHz reference, so that I just take the appropriate harmonic and amplify it to a power level that suits the mixer I have to use for that particular 30 MHz band? Would it be better, perhaps, to use DDS to generate the LO frequencies I want?

I would suggest a form of PLL, similar to a TV set-top box converter for down-converting old UHF channels to VHF. The LO needs to increment only in 30 (perhaps 15 for 'havsies') MHz increments. The direct LO frequency sample can be fed to a prescaler whose output (at a lower incremental frequency) can be applied to a digital counter whose output is phase-frequency compared to a stable reference frequency. The LO output to the Mixer needs only to be above the minimum specified level and below a maximum, also specified if a ready-built mixer is used. At below-1-GHz frequencies you can get away with attenuating the LO level with a carbon-comp T or H pad figured for the common 50 Ohm system. MiniCircuits also has VCOs of many kinds in stock and most of those cover a half to a full octave in electronic tuning range.

Layout of the UHF needs, realistically, only an approximation of the PCB trace width for "50 Ohm lines" on whatever substrate is used. For very short trace lengths the "mismatch" isn't noticeable and, for under-1.2 GHz frequencies, I've used #20 AWG wire without problem in performance! :-)

In thinking more about it, salvaging an old TV UHF channel converter might be a better idea, modifying its output to go DC to 30 MHz instead of stopping at Channel 2; a few for cable TV service go lower in output frequencies for built-in cable service functions, depends on the maker of the set-top and the cable service. All of those seem to operate at 2 MHz increments but use "in-house" PLL subassemblies, circuit diagrams printed on unobtainium. :-(

Prescalers - as stock items - are now scarce but exist mainly as "house number" special orders. A few dealers have them as old stock left-overs. Nearly all operate up to 900 MHz so their ability to prescale a UHF LO is no problem.

The SDR-IQ is a fairly precision instrument as a spectrum analyzer and it deserves to have a down-converter checked out with good test equipment. Any one of the (now ancient) HP-608 signal generator models can cover up to the 70cm band with known RF output levels. That's another thing to keep in mind.

I hope some of this long text is a help to you.

73, Len AF6AY

I know it it's not a perfect solution, but this could be a good starter: find a selective Jerrold of OAK CATV converter. There must be thousands of them around for free. Try to improve the stability of the local oscillator; replace the jerky PLL oscillator with one or a few decent synthesizers, work on the input sensitivity, etc..

Have fun!

I think I will start by converting the impedances to turns ratios,
Perhaps this will make figuring out how to connect the transformers
easier. Are each of the secondary windings designed to handle the full
power rating of the transformer or will I have to derate it if I use
only the two ohm winding?

This comming Sunday...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday April 15th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 600 sellers and free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if you're lucky enough to have a copy of our ad) and sellers spaces are $20 for the first and $15 for each additional at the gate.

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which offers a 30% discount. By prepaying you get a discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

<<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2007 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space
$15 Additional Spaces
Admission is after the prepaid vendors

Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
** You may not sell. **
$15 per person at the gate.

Google for IRDA circuits/projects,etc.. there's alot of info out there.
I made one a few years ago,not hard at all.(all of about 3-4 components)

Hello all,
I have discovered how much fun tubes can be, and am in the process of
planning one or more transmitters to go along with my 2-tube
regenerative receiver. Now, I'm only 23 years old, so I'm in the
process of researching hollow state technology. Could you please put
together a short list of the "best" ARRL handbook editions? I have 99
and 05- I'm just looking for a few years to watch for on amazon, etc.
Of course, recommendations for other books would be appreciated, too,
but I'm on a tight budget...

Thank you very much in advance for your advice.

Ross, NS7F

IMHO what you should do is go to a library and find where the major "houscleaning" was done and then get the previous edition. For example, I have a 1995 (blue) edition, and it was much better IMHO than the 1996 (red) which I also have.

In any case, collecting a set of them may not be of much use to you.

Tubes have not changed much in a long time, so getting an early edittion with lots of tube data and then copies of articles you want may be a much better use of money and space.

73.

Geoff.

I have the 1964 and 1966 versions and there is VERY LITTLE difference between them.

They have designs for 4 simple transmitters with power that range from 10 watts to 100 watts. Also, they have a fairly good 'teaching' on transmitter and power amplifier design techniques [for tubes of course!].

I agree with the post that responded that they are quite similar within a basic technology. So, if vacuum tube simple transmitters are your passion, [desire, wants, likes, etc.] any of the ARRL handbooks from the late 50s to mid 60s should meet your needs.

Forgo the handbooks and look for QST magazines from the
40s thru the early 60s. Many larger libraries have the bound
editions... At worst, look for some used QST on CD editions
from that era.

Pete

Ross,

If you're interested in hollow-state technology, there are lots of *free* resources on the 'net:

First up is Pete Millett's excellent book site:

http://www.pmillett.com/tecnical_books_online.htm

There are many excellent reference books online there, free for the download, including ARRL Handbooks from 1936 and 1941 (IIRC). The files are often large but if you have DSL or better they only take a few minutes. With dialup they become a late-night hit-the-download-button-and-go-to-bed thing.

He also has tube data online:

http://www.pmillett.com/hb-3_tube_manual.htm

The Glowbugs website has lots of downloadable info:

http://www.mines.uidaho.edu/~glowbugs/index.html

including some good manuals and articles on WW2 military surplus:

http://www.mines.uidaho.edu/~glowbugs/Military__and__Surplus.html

http://www.mines.uidaho.edu/~glowbugs/PDF%20files/

On the Glowbugs website are instructions on how to sign up for the Glowbugs email reflector. Lots of good folks trading info on their projects.

"Bunker of Doom" site with lots of stuff:

http://www.bunkerofdoom.com/

Transformer catalogs and other data:

http://www.bunkerofdoom.com/xfm/index.html

Another good site:

http://www.antiqueradioarchives.com/archives_index.htm

If you want the actual books, I would recommend

ARRL Handbooks from about 1954 to 1965, and RSGB
Handbooks. IMHO the RSGB Handbooks go into more
depth on technical subjects, and have better construction
articles, but the use of European tubes and other
unobtanium parts makes them difficult to duplicate.

Also be on the lookout for the ARRL publication "Understanding Amateur
Radio" (1st edition) ,
which has some good lowcost projects and well
written explanations.

Sign up for the Glowbugs reflector now!

If you are interested in tube gear then the ARRL handbooks from the early 1950s would be good. By the 1970s, the trend was toward solid-state gear. Of course, the 1940s handbooks are good too, but I like the ones from the 1950s best.

> I was doing a bit of reading lately and came across some interesting topic one being VCO. The VCO I saw used a Optical Shaft Encoder (OSE). The setup used was rather odd looking to me and didn't look that mechanically stable.
>
> Could someone explain VCO to me? And, also what type of VCO would be the best in a transceiver considering the technology of the past 10 years? Are there digital VCO's?
>
> Greg
>

A VCO is a Voltage Controlled Oscillator. It's not a different type of oscillator, it's merely some existing type of oscillator with some element changed so a variable voltage will vary its frequency.

What is controlled by the varying voltage depends on the design, but for pretty much all radio type VCOs, a voltage variable capacitor replaces the mechanical variable capacitor.

At it's simplest that means you have an oscillator just like you had before, but you tune it with a varying voltage. So you'd have a potentiometer on the front panel that would supply a varying voltage to that VCO. This oscillator would be no different from the same oscillator with a variable capacitor, give or take how well you regulate the control voltage.

That in itself doesn't do much, other than maybe making the oscillator smaller (the voltage variable capacitor is usually a small semiconductor which obviously takes far less space than a variable capacitor), and in some cases it can be easier to get the parts than find a variable capacitor.

Where they really shine is as part of a PLL, Phase Locked Loop, that locks the VCO to some standard frequency. There, a phase comparator compares the VCO with the standard frequency, and the output of the phase detector is a varying DC voltage that controls the VCO. If the frequencies of the two oscillators don't match, then the control voltage out of the phase detector adjusts the VCO to the exact frequency. By adding circuitry, one can synthesize every single needed frequency, which is where a PLL really becomes useful.

You aren't seeing VCO "controlled by an encoder". The optical encoder is mechanical, and cannot directly control the VCO. (The optical encoder just sends out a stream of pulses, the more pulses the more you turn the knob. And there is a secondary output, also a stream of pulses. The difference is, one of those outputs goes high before the other; which one is dependent on which way you turn the knob.) You have to turn the pulses from the optical encoder into something else. And in this case, it's being used to control something digital, what would depend on the actual design in the book. One scheme would be it controls a series of up/down counters, and the outputs of them control a variable divider chain in the PLL, between the VCO and the phase detector. Other schemes might have the optical encoder feeding a CPU of some sort, and the CPU does some of the work before controlling something else (such as a variable divider chain, or directly control some other type of synthesizer).

It doesn't have to be mechanically stable, because the encoder is not directly controlling the VCO. It merely supplies information, which way you turned the knob and how far.

One thing to be considering is that the book is intended to be a construction project. It takes the whole book to describe the transceiver, and it's not really about teaching a more general theory. Once you start wanting to change things, you'd be better off starting with some other book, that is less specific, and even shows simpler circuits. Because then you get the background information, and it's far easier to start with a basic SSB transceiver (basic in the sense that it's single band and uses a mechanically tuned variable oscillator), get that going, and then add the "bells and whistles" (done right, you can then replace the VFO with some synthesizer).

Now if that isn't a contradiction! I think the point is all were welcomed,

```
because they were QUALIFIED. Now we have no-coders who haven't the vaguest idea
of ohm's law, claiming the privileges that were once earned by study and effort.
Lazy slobs like that were not, and never should be, "welcomed."

The Return of The Harry Thomas Show

The "garage talk show" that is reaching out to Worldwide Usenet

after hiatus he is back to inform the people of deception and corruption.

Hosted by Harry Thomas;

The Harry Thomas Show - week in review is a 4 segment show. We have had

tremendous response and we want to thank our Listeners.

Keep them e-mails coming and thanks for your support !

harrythomas@netzero.net

The Show is recorded on Wednesdays
Posted to usenet on Wednesday Nights   to;
alt.binaries.great , - alt.binaries.radio.misc , -
alt.binaries.multimedia.documentary -alt.binaries.sounds.radio.misc, -
alt.binaries.sounds.radio, - alt.binaries.sounds.wma, - and

>Could someone explain VCO to me?
```

"VCO" is an acronym for Voltage Controlled Oscillator.

The mechanism for tuning is that the frequency-determining resonant circuit uses (usually) a voltage-controlled variable capacitor to adjust the oscillatory frequency. A voltage- or current-controlled variable inductor my be used to do the same thing. "VCO" has become a rather generic term applied to any variable frequency oscillator controlled by a voltage or current. A few mix that up with "VFO" or Variable Frequency Oscillator, an even more generic term for a (usually) manually-controlled oscillator.

Typically, the voltage-controlled variable capacitor is a reverse-biased diode in which the diode junction capacitance varies dependent on the reverse-bias voltage. The more rare variable inductor type of VCO changes its inductance dependent on the amount of DC current changing its partial magnetic field saturation characteristics.

"Mechanical stability" of a VCO has no direct parallel to the old-time mechanically-variable manual-tuning variable oscillator. The fixed components of a VCO require stable construction, yes, but the frequency stability depends on the CONTROL VOLTAGE (or current) REGULATION AND STABILITY.

A VCO as a subsystem on an IC may not require any external capacitance or inductance; some, including component assemblies in a small enclosure include all of that. An older form of VCO is the free-running (astable) multivibrator circuit where the square-wave frequency is varied by bias voltage on the base-gate-grid of the multivibrator. The demand for digital-IC-based VCO multivibrators has been slight in the last two decades so most of those have been withdrawn from production.

"OSE" is not a common acronym for a rotary incremental digital shaft encoder. [Ocean State Electronics in Rhode Island uses "OSE" as a logo] A shaft encoder REQUIRES an interface circuit to convert the directional rotation digital signals to something that can CONTROL a VCO or some other circuit producing a controlled, variable-frequency output. Call it "shaft encoder" for short.

>And, also what type of VCO would be
>the best in a transceiver considering the technology of the past 10
>years? Are there digital VCO's?

Greg, in all fairness to most of the readers of Homebrew, you are asking questions which are too general, too basic, and require book-length replies which should have lots of illustrations to fully explain details. I would suggest you FIRST engage in some self-study on specific topics to round-out your own knowledge on circuit basics. I doubt that most of us want to "explain how to solder" for example since that is something that can be self-taught on the bench.

Today's transceivers, receivers, transmitters use variations of the "DDS" or Direct Digital Synthesizer for their main tuning circuit sub-system. The DDS is a later advancement on the PLL or Phase Locked Loop, an incremental-step frequency synthesizer. A DDS (almost always a SOC or System On a Chip) can produce a much smaller incremental step of frequency. Both the PLL and DDS use a single quartz crystal oscillator as the frequency reference; all output frequency steps of a PLL or DDS are of quartz crystal stability. Most manually-tuned PLLs or DDSs are set/adjusted by a form of rotary shaft encoder supplying (through a rotation-sensing digital interface sub-circuit) the "up" and "down" incremental frequency step control signals. Frequency display in today's radios is obtained indirectly from the DDS IC, converted from the step control sub-circuit output to the DDS output frequency plus/minus whatever the transceiver needs to make the display equivalent to the "air frequency" at the antenna.

A DDS is about as close to a "digital VCO" as today's technology gets...but it CANNOT be explained easily without lots of text, illustrations, diagrams, knowing some basics about "digital accumulators" or "analog-digital conversion." A DDS is RELATED TO, but not quite the same as a PLL.

A PLL uses a voltage-controlled oscillator as its main output. That output frequency is fed to a variable digital divider that produces an output that is an integral-division of the frequency of the VCO. That divider output is compared, in a phase-frequency detector (digital) to a fixed, stable reference frequency. That comparison output is filtered to produce an up/down control voltage for the VCO. In this frequency-control loop the VCO is maintained on-frequency to the reference frequency times the number of divisions in the digital divider. Changing the divider increment changes the VCO output frequency. The digital divider increments may be fixed by switches or it may come from another digital sub-circuit that is directly controlled by a rotary shaft encoder for manual adjustment.

The above is a rather basic description of a standard PLL. DDSs have various forms but their control-comparison to a single reference frequency is CONSIDERABLY different from a PLL. A DDS is enormously useful in a modern transceiver, especially in SSB tuning. My new Icom 746Pro, like many modern transceivers, can tune in 1 Hertz steps making SSB reception a snap for clarity...plus having more functions to allow easy digital control of modes like RTTY plus a direct internal interface to its digital signal processing. It uses a DDS as the basic frequency control. My older Icom

R-70 receiver used a PLL, actually three PLL sub-systems, to achieve 10 Hertz step tuning, quite good for SSB but not as precise as modern versions. The even older Heath SB-300 family of transceivers used indiidual-band quartz crystal oscillators and mixing with a manually-tuned analog VFO (excellent stability) in a "Collins Radio" architecture.

Now, in all seriousness, if you want to experience learning about transceiver frequency control systems, I'd suggest you concentrate on the old, conventional L-C non-digital all-analog methods. It doesn't have all the high-tech buzzwords attached, but they DID work quite well when attention was paid to certain critical factors in their design/assembly. Basic theory (not just assembling someone else's design) of those will apply to more sophisticated circuit methods. In progression from L-C analog methods to PLLs, one gets to know digital circuitry and how those behave. In progression from PLL to DDS one can get into spectral output and theory of modulation (in general) along with sampling theory and that old devil, "aliasing."

If you start in on self-learning, there is an enormity of material available to you in printed and electronic form. I'd say most of us in RRAH have been there and done that in various areas and ask/discuss more definitive details and comparisons.

73, Len AF6AY

Quote: "VCO" is an acronym for Voltage Controlled Oscillator.

Well, yeah I gathered that, after more reading. I see that people
have used them in music synthesizer modules.

I'm sorry for being a bit elementary and maybe long winded here, I'm
still trying to learn as much as I can while I am doing and reading,
etc.

The VCO in the transceiver project in the book used some sort of motor
control and shaft encoding.

I did a google type search for HF DDS Generator using WebFerret. Came
up with over 175 results. Seems people are using 16F chips and AD98xx
chips.

Well, anyhow thanks for all your replies.

Keep that up, by all means. Amateur radio is about radio-electronics technology applied to communications.

> The VCO in the transceiver project in the book used some sort of motor
> control and shaft encoding.

That's the common method of manual control now...but in-between the rotary shaft encoder (attached to the manual knob) and the VCO itself is a large collection of digital circuits. Be prepared to learn more about digital circuits, gates, flip-flops, etc. Not difficult, just strange if your background is only analog circuits.

> I did a google type search for HF DDS Generator using WebFerret. =A0Came

Analog Devices is the most-often used supplier of the basic DDS IC. Microcircuits' PIC series (the '16F' family) of microcontrollers is used to do the "translation" between manual frequency data input and the data needed to set the DDS to the correct frequency. Now that translation IS more difficult for many, experienced in electronics or not.

If you are intending to go into frequency synthesizers for your own projects, I'd suggest you concentrate on PLLs first. Getting to know those and WHY they work will lead into the various DDS methods of frequency generation. The general digital circuits of both PLLs and DDSs are related.

I helped my CW hearing ability by making a long speaker box which allowed the speaker element to slide up and down the length of the box, changing the resonant pitch of the box, which allows an audio "peaking" effect.

This has the effect of amplifying the cw sidetone at different pitches and also increasing the S/N ratio. Usually, the QRN gets lost in the longer travel up the wooden box.

I'm understanding this more and more as I go along. Thanks to the
first two replies on this thread. I'm still learning more about
electronics in general. But learning about RF and HF electronics
really has been interesting.. and may prove hefpful.

I'd at least like to start learning more about the project in that
book though. I know that it's primarily a building block learning
process.

To Len, I know exactly where that is.. :-)

Greg

I have an old Murch Ultimate Transmatch that I would like to put a switch in so that I can switch the transmatch in or out of the circuit. What kind of switch should I use that will handle the 2KW power rating of the transmatch?

Thanks in advance for any advice.

Hi everyone,

I've been getting a lot of stress from my girlfriend. The problem is jackrabbits. There are a lot of them where we live and at this time of

year
they box each other quite viciously. My girlfriend gets terribly upset
about this and I get nagged as a result. I've tried
to explain to her that it's just nature and they're only establishing
territory for breeding and whatnot and to just let them get on with
it.
However, she won't see reason and insists I do something to break the
fights up. So I
need your help. I've decided the best solution is to build a 'bunny
zapper' type stun-gun. Now it's self-evidently important
NOT TO KILL THE RABBITS, but they must get a shock sufficient to get
the message
across that violence is unacceptable. IMV it should therefore carry
JUST enough
whack to blow their ears clean off. So how much
voltage will this application require? I assume we're talking
kilovolts, but how many?
Does the rabbits' fur resistance affect the calculations?
I have tried researching this on the internet, but it appears no one
has yet
carried out any clinical trials into the problem. So I need you guys
to give me
a ballpark figure. Better yet, if anyone knows of a commercial outfit
that
manufactures stun-guns for use
against jackrabbits can they please post a URL? Finally, is there an
ecologically sound way of disposing of/recycling all the blown-off
ears?
Thanks.

A note to the sceptics:
There is a sound scientific rationale behind my intended approach:
I'm aware that female jackrabbits select their mates primarily by
the length and lustre of the male's ears, so any male with just
a couple of smoking, charred stumps sticking out of his head is
unlikely to
be successful in attracting a mate. In this way, hopefully the
genepool of
the most aggressive rabbits will diminish over time.
Lastly, if we can get the concept accepted into the mainstream as a
legitimate
hobby or sport then maybe we call ALL make a few bucks out of it.
Let's all try to work
together on this one, guys.

pb.

<snip>

Aren't you talking about hares?

http://www.enchantedlearning.com/subjects/mammals/lagomorphs/Jrabbitprintout.shtml

They may be called jackrabbits in the U.S. but I've never heard of
them being called anything but hares in the U.K.

According to this web-site

http://www.bbc.co.uk/nature/wildfacts/factfiles/192.shtml

the boxers are unreceptive females fighting off males, rather than
males competing for territory, so your girlfriend is going to want you
to able to direct your stun-gun at the male participant, which is
obviously going to be difficult if neither of you has yet realised
that you have been looking at male-female encounters.

A properly programmed image analysis system may be able to do better than you can in determining the sex of the hares - it turned out to be relatively easy to set up an image analysis system to sex day-old chickens, a skill that humans can only acquire after a lot of practice - but you then have to couple this to some kind of long-range non-lethal projectile system, like a taser, with a better long range accuracy than anything I've ever heard off.

It's not a job that I'd take on with any high expectation of eventual success, and I've got a higher opinion of my own competence than I have of yours, though this is not an opinion that you will share (another one of your problems).

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.soldersmoke.com

Listen at: http://www.soldersmoke.com

SolderSmoke #52

April 1, 2007

-- Excelsior! Jean Shepherd's stories about ham radio.
-- Legislation to ban hobbyist soldering.
-- History of LTSpice.
-- Workbench update.
-- SPECIAL GUEST EDITION OF BANDSWEEP: A satellite pass over M0DHP.
-- MAILBAG: Using an AM radio to interfere with the Chicago White Sox. SolderSmoke in 1930.

Tired of listening to Frank Sinatra or NPR on your I-Pod?   Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack? Tune in to SolderSmoke!

RSS FEED: You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.
http://www.soldersmoke.com/soldersmoke.rss

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.soldersmoke.com

All the programs are available here.

I hope you enjoy the program. Please send us feedback.

Paul

What you need is a Border Collie. Besides being a loyal
and beautiful pet, they can be trained (natural instincts)
to herd and escort the bunnies off your property, making
them your neighbors problems. Otherwise, get a Lab,
they will eat the bunnies and again the problem will
be solved.

Hope this helps.

Pete k1zjh

Almost any kind of switch you want, including the miniatures, providing that you don't do the toggling during the transmit mode.

A varmint rifle or slingshot, and the introduction of rabbit stew into
the menu? You may get resolution the very first time the serving dish
hits the table. You could save money twice -- meat is expensive, and so
are girlfriends.

You wouldn't eat the jackrabbits around here (Lepus Californicus) more
than a couple of times before you contracted one of their diseases.
Stick to chicken. It tastes like jackrabbit, anyway.
73,
Tom Donaly, KA6RUH

Hey folks,

What is going on with the Russians selling obviously defective junk and representing it as first quality good merchandise??

Of course there are dubious characters at hamfests but this was just over the edge this year!!

Stacks of CDR drives, Hard drives, all marked 'bad' somewhere on them and marked $5 each or in that area. When asked about the drives and not pointing out that it is already marked as 'bad' the guy replies in crappy english "I have not tested all of these but every one I tried has worked". So I go out and drag my laptop in and guess what??? Five out of five random drives I selected failed completely. Some didn't even spin up. Are these guys dumpster diving outside a factory repair center or is this the stuff we sent over to Russia to have disassembled for the recycle value? Well I also tried some RAM chips. Again, the very bags these things were in were marked 'Fails memory test'. The seller represented them as 'good pull outs'. They couldn't have been any worse if they had been struck by lightening. It is one thing to say to the buyer "I really don't know the condition, you're buying as-is", or "I haven't tested it, but if there is a problem you may choose a differant one until you find a good one". These guys were blatently misrepresenting garbage as good useable merchandise!!!

We went through this with the Asian wave, then came the East Indian

wave, now it's the former Soviet block ripoff artists.
I didn't get any business cards from the guys but I wish I had.
These jokers will kill hamfesting by causing folks to think it is
nothing more than a ripoff field-day for the un-suspecting and I
really think these less than reputable folks should be reported
to the hamfest commities.

Caveat Emptor is one thing, but this was just outright lies on the
part of the seller. Pity those who are just starting out in this
hobby and looking for a bargin and get scammed, buy foriegn nationals
at that!!

I did find some Ram for my laptop, a 6C5 vacuum tube, a 'point
and shoot' temperature reading device, some doorknob capacitors,
a 21 pin Cinch Jones male-female pair, and an external floppy
drive for a Thinkpad. All these items were in perfect condition
and the sellers (who were not Russian) were more than happy to
demonstrate the first-rate quality of those items. Hats off to
the rare breed of honest hamfester!!!!

I was browsing through Terman (2nd edition) last night and read a paragraph about "Dual Grid and Class B triodes". According to Terman, if two concentric (but similar pitch) grids are put in the triode and then connected to each other as a single control grid, the result is a high-mu triode that needs zero bias for Class B operation.

I do not see dual-grid tubes mentioned in Terman's 3rd edition in the same way.

Googling the term, I see that the 52 tube seems to be an example where both grids are brought out to individual terminals.

I also see that sometimes "dual grid" is used to describe RF tubes where there are two pins for a single grid (to decrease inductance I guess), I'm not talking about these tubes.

The two-grids-connected-together characteristics remind me a lot of, for example, the 811A (the most familiar Class B triode I'm familiar with), but that only has a single grid terminal. Am I correct that the internal grid structures of an 811A are essentially that of two connected grids? If not, what inside an 811A makes it zero-bias high-mu class B triode, as opposed to say its externally similar non-identical-twin the 812A (a low-to-medium-mu triode that needs bias)?

I also note that Terman claims that the dual-grid structure forms a very good electrostatic shield between heater and plate, and see that 811A's are often used in grounded-grid connection in RF amps. (Must be a bitch to neutralize in common-cathode).

I've been intermittently playing around with SPICE to model 811A curves (including grid current at positive grid voltage) and none of the conventional triode models work right at all - its curves are more like a pentode (in fact it's pretty trivial to fit it this way if you let the diode characteristics take over at low plate voltage).

```
Tim.

=======================================
The #46 is another. The 46 was popular in a number of Atwater Kent
radios circa 1932-33.  Class B Push-Pull output stages in high-end
radios had a brief run in the early 1930s, then faded into history.  --

>
> The two-grids-connected-together characteristics remind me a lot of,

> for example, the 811A (the most familiar Class B triode I'm familiar with), but that only has a single grid terminal. Am I correct that the internal grid structures of an 811A are essentially that of two connected grids? If not, what inside an 811A makes it zero-bias high-mu class B triode, as opposed to say its externally similar non-identical-twin the 812A (a low-to-medium-mu triode that needs bias)?
>
> I also note that Terman claims that the dual-grid structure forms a very good electrostatic shield between heater and plate, and see that 811A's are often used in grounded-grid connection in RF amps. (Must be a bitch to neutralize in common-cathode).
>
> I've been intermittently playing around with SPICE to model 811A curves (including grid current at positive grid voltage) and none of the conventional triode models work right at all - its curves are more like a pentode (in fact it's pretty trivial to fit it this way if you let the diode characteristics take over at low plate voltage).
>
> Tim.
>

Dual-grid tubes were popular for a short while. They were touted as being versatile -- connect grid 2 to grid 1 and you had a high-mu triode, connect grid 2 to the plate and you had a low-mu triode. Judging from my tube data books, it didn't take folks long to decide they just wanted one or the other, not two in one package.

The curves look pretty triode-like to me, once you take into account the fact that the thing is running almost exclusively at positive grid voltages. Perhaps the SPICE triode models aren't taking this into account?

Hi RATs!

I have a huge P-P 46 vintage amp. It is not yet functioning. It is
clearly very well built :)

Grow up, Class "A" does not mean good, it means simple ... which,
despite some journalists' daydreams, is not exactly the same
thing ...

Happy Ears!
Al

A push-pull pair of zero-bias class B triodes is even more remarkably simple.

When I first saw the schematic of a 811A P-P audio amp, I was astonished to find not a single resistor or capacitor in the circuit. Two tubes, input and output transformers, and connections to a filament supply and a plate supply. That's all there is, folks!

Tim.

I've been going to hamfests for 25-35 years. I've had my share of buying stuff that was said to be good and it wasn't. Or, it was less than what the guy said was what he thought it was. I also bought stuff that worked like it should and like the guy said.

Are you sure your test was under reasonable circumstances? There are lots of hardware incompatibilities, software driver incompatibilities/glitches, and they could have been marked "bad" because someone else didn't test them or install them properly. If you have bad vibes about a deal, don't buy the stuff. If you saw a lot of stuff marked "bad" why didn't you tell them "Hey, this word means it will not work, now why do you think its good?"

I bought computer stuff from thrift stores over the years (monitors and boxes) and 2/3 of the stuff works just fine, the rest goes into the garbage can. In the end, its the price of very cheap computer stuff. 1/3 has to go to the garbage can.

I'd rather concentrate on the overall picture (I was at Timmonium, Saturday) and I thought the tailgater population and the covered space population was down about 20% from what I expected.

Anyone go both days? Hamfests have been in a slow downward trend for about the period when the internet started getting popular.

This is very true and interesting. RCA figured out you could strap the control and screen grids of certain power pentodes and use them as low or zero bias triodes, and a couple of RCA theater amps do this. This is also seen in AM era editions of the W6SAI Radio Handbook for modulators. It is simple. It works. Based on long time experiments it was concluded it doesn't sound very good at all.

I have never tried it, on the theoryu if it worked very well it would be popular.

The 811 is certainly an attractive tube economically. It has a mu of 160 as I remember. The Altec 1570B used them as did the Gotham Audio cutter head amp using a GR toroid for output.

 Several of the last of the RCA MI-series cinema amps did this with
6L6s and I believe 6146s. None are desireable to the audiophile in
stock form.

 They showed why toroids are a bad idea for opt's very well, although
there are still a lot of people not listening. With a conventional or
C-core transformer and a revised feedback loop the basic design is
well worth study, though.

 The 811 can be substituted in the MI200 McIntosh if the proper
intermediate transformer is put in so as to get the filament voltage
at the 6.3 rather than the 10 volts of the, I think, 8005s. Although
the amplification factor of the 811 is way too high it works anyway.
Distortion still meets Mc specs. We wound one, in fact, where I worked
on a toroid, because we had plenty of scrap surplus transformers we
could dewind (and take the copper home.) And a Gorman winder, which
makes winding toroids pretty fast and simple. The 811s pull more
current but the Mc filament transformers never even got hot.

Because using conventional circuits the distortion was terrible. True Class B operation works well only at high continuous levels without extreme measures such as Wiggins and Mcintosh/Gow/Corderman afforded. Al Bereskin at Baldwin designed the "poor man's Mc" for organ use and it was published in an extremely good DIY article in the IRE journal in '55 or '56. It never got below 2% THD.

The dual grid tubes strike me as a gimmick. Any pentode or beam power tube can be connected at least 4 ways. Connect the screen to B+ and it behaves as a pentode or beam power tube. Connect the screen to the control grid and it becomes a high-mu triode. Connect the screen to the plate and it becomes a low-mu triode. Connect the control grid to a low positive voltage and drive the screen and it is a space charge triode.

The 811 has only one grid as do other zero bias tubes like the 6N7 and 1635. They just wound the grid with many turns spaced close together to get this characteristic. Low-mu tubes like the 812, 2A3, and 12B4 have few turns spaced far apart. The only triode I know of with two grids is the 6C5. The second grid is internally connected to the plate.

I have seen circuits using 6V6s with the screen tied to the control grid to make a zero bias triode.

The old ARRL handbooks (50s?, 60s?) had a listing in their tube tables for using a 12AX7 as a class B zero bias output tube. They said it could produce 7.5W. I never saw a circuit that actually used one this way, however.

I'm astonished by the naivity of this!

Why would you think that a part or bag of parts marked "bad" should really be good, and that you should be getting good parts for the price of bad ones? This didn't raise any red flags for you? If you went to the supermarket and found a piece of meat that was marked 2 weeks out of date, would you take a chance on it because the merchant said he ate some last night and he didn't get sick? Even if the seller said that most parts that he tested were good, the fact remains that the parts were marked "bad". If you bought parts marked "bad" and they really were bad, then the only questionable part of the transaction is whether you paid too much.

There's an old saying that seems to apply here: "Who's more of a fool, the fool or the fool who follows the fool?". This isn't a matter of deceitful Asians or East Indians, or Russians, it's a matter fools rushing in where others fear to tread.

I knew a guy who used to go around to hamfests, fleamarkets and such things buying drives that were bad. He had memorized a list of manufacuturers and their date codes that were being repaired under warranty, athough there was no recepit, etc. They warrantied the drives for X years and if you called/emailed them with the serial number for a drive they would replace it free if those X years had yet to expire from the date of manufacuture.

I of course had no such luck, the one drive I bought from a ham at a hamfest with a warranty was dead. He gave me a card with his phone number on it, the phone was never answered. :-(

Other people also buy the drives beacuse without any testing there is a 50-50 chance it's circutry card on the drive or the mechanics. If you can inspect them carefully, or know the reputation of certain models, you can imporve the odds. If you buy enough drives cheaply, you can mix and match parts and get working drives out of them.

Memory is also a good bet, if you have the correct tools and skills, and get them cheap enough. Memory is discarded if one chip (of 8) or more is bad, so if you buy two units (SIMMs or DIMMs) there is a good chance you will get 8 working chips out of them. You need a diagnostic tool that will pinpoint the bad chip, and the skills to remove them and re-install good ones.

Obviously the skills are not commonplace and the tools are expensive, but if you do enough, you can learn to do it easily and pay for a set of tools.

Since just about everyone I know has a box full of "dead" RAM (except people who don't fix their own or others computers, or just throw it out), you could get all you need for next to nothing pretty quick.

So there is a good market for bad computer parts, but not a good chance
of buying one and having it be good.

Geoff.

I'll have to ask you to read the entire thread for yourself.  I've no reason
or need to repeat everything.  However my complaint was that the original
article was derogatory towards both hams and CB operators.

Dee, N8UZE

I can best deal with the Childish Broadcast (CB) of
the rather silly and infantile child below by re-iterating one of
the threads of the past few days....

"On a daily basis, this NG is a forum seemingly
for escapees from the school playground, with
gratuitous and offensive personal remarks
originating from even those who have not
been part of a conversation and who could have
no reason, other than uncontrolled infantile
emotions, for interjecting as they do.

Is such public and international demonstrations really
the way forward; the way for PR for the future
of Ham Radio. I say, "No!".

I cannot see how something that is a technical pursuit
with traditions of gentlemanly behaviour could
possibly give way to the childish sneering that is
typical of this NG."

I disagree. it is very complimentary towards _REAL_ Radio

Hams. However, it if it is derogatory towards those
who are really no more than CBers-masquerading-as-Radio-Hams
(Possibly callsigns in the "N8" series fall into that category?)
then that is good.

Ham Radio is a technical pursuit for gentleman. Those who think
that they are Radio Hams but send their rigs back for repair are
"CBers-masquerading-as-Radio-Hams", no more, no less.

If you are one in that category, then I apologise that you were misled
into thinking that you are a Radio Ham by others who ought to
have known better. We have such others in Britland in the shape
of the RSCB, "The Radio Society for Citizens Band" an organisation
that provides premises for meetings of the British Citizens Band
Confederation.

Putting this into its correct perspective, this came about
as the result of a malicious and perjurous complaint made

by Brian Reay, M3OSN, and it is at Brian Reay's door (and now also the RSCB's door) that any complaints of Bad PR must be laid.

Brian Reay subjected me and my close family members to a campaign of harassment wherein he published repeated racially-aggravated pornographic emails to these NG. He maintained this campaign over a period exceeding two years. How his sick-minded obsession was ever relevant to Ham Radio and to these NG has never been established.

Having put up with this for an extended peiod, I then discovered that not only was Brian Reay a schoolteacher, but he was publishing his sick racially-aggravated pornographic emails whilst under training at a Girls' School.

I did no more than to assert the right of reply in defence when I asserted that no-one with such a sick-minded history of international publishing should be a school teacher UNDER ANY CIRCUMSTANCES.

I hold to that view today.

Brian Reay's infantile response to having the tables turned on him was to make a malicious and perjurous complaint to his fellow w*nkmasons to allege that I was harassing him rather than the oher way around which is obvious from the Google archive to this day.

Mike Gathergood is well aware of these facts, but it must be apparent to many of you from the way he hangs around every posting of mine that he is also a sick-minded obsessive. best ignored.

I have not been able to establish the name and address of the school in Strood, Kent, where he teaches.

I would be grateful if anyone can furnish this information,so that I can make representations supported by evidence to the governors to seek that Brian Reay be dismissed because of his history of racially-aggravated pornographic publishing.

But with today's microprocessor, DSP and firmware laiden transceivers,
would repair be both possible and cost-effective once the radio amateur
has purchased a SMD rework station and expensive test gear, etc, that
would only be used for the one repair, etc?

I've done surface mount repairs and /or modifications in the past without a SMD rework station so it can be done. I find it a bit more difficult now due to poor dexterity in my hand but, while I'd not take on a repair for someone else (in case it goes pear shaped), I'd probably have a try on some thing of my own- unless it was very high in value. I've picked up one of those illuminated magnifying lenses and, with practice, you can solder SMD stuff while looking through that. The key thing, assuming you want to replace a component, is to get it off the PCB without damaging the pads. For a multi-legged beast, you can snip the legs and remove them one at a time. A bit of heat on the body of the package will help if there is any glue under it. Ball grid arrays are more of a problem.

As regards the DSP side, if that goes bad the repair is probably more hardware related (ie a bad component) so the firmware doesn't really come into it. I've not checked, but some of the DSP radios may well use one of the "off the shelf" DSP devices that you can get the development environment for. If so, you could write your own code- assuming you Know what you are doing.

That is a bit unkind Mark. Not all amateurs can afford to scrap radios that, in real terms, are beyond economic repair. Equally, "fixing it" is more fun than buying a new one, or maybe paying someone else to fix it.

I've not checked, but some of the DSP radios may well use one of the "off the shelf" DSP devices that you can get the development environment for. If so, you could write your own code- assuming you Know what you are doing.

Fortunately I prefer non-DSP radios and ones where I can effect a simple repair - especially Icom 735 and Yaesu FT747 - simple and reliable sets and very flexible and forgiving with non-fancy aerial systems unlike some modern sets that 'freak out' when a high SWR is presented.

Thinking of adding DSP to the 747 sometime or maybe trying a PC based real-time solution.

Leigh...

indeed but I must since you are bring this up did read any of the
context?

the refernce to cost effective had noth what to do with the price of
gear but the price of human effort in licesenure

Will, the IC756ProIII is a dream and works fine with a simple end fed for
general HF use and a reduced size loaded dipole for 5MHz.

> Thinking of adding DSP to the 747 sometime or maybe trying a PC based
> real-time solution.

The SDR is a good place to start with this type of thing, there is a wealth
of material around and lots of people experimenting.

Personally, I like a radio with a proper front panel, with knobs you tweak,
switches you push etc.

There is surprising little anecdotal information on the web/usenet
about the SA607 or SA608 receiver chips. These are similar to the
SA605, but run from 2.7-7.0V and have buffered limited output and
RSSI's. Has anyone use either of these chips? And if so, can they tell
me:

1) How does the SA607/8 performance compared to the SA605 when both
are run from a 5V supply? The datasheets show the SA607/8 performing
worse (SINAD of -117dBm as opposed to -120dBm for the SA605), but
'07/8 are running from 3V while the '05 is running from 6V so it is
not a fair comparison.

2) The only difference between the SA607 and SA608 is the later
exposes the RSSI buffer amplifier feedback. What it the point of
making two different products just for this reason? Is it used to
adjust the gain (but this is a buffer amplifier?!)

3) Can anyone tell me what the output looks like of the SA607/8 at pin 9 or 11 (limiter output), meaning, the minimum and maximum voltagea of the 455kHz square wave when there is a strong RF signal output?

It amazes me that about seven analog receiver chips in the SA line are still offered by Phillips (and in-stock at Digikey no less) where so many other companies have discontinued theirs.

Ben

I've seen tons of posts about converting FM signals to AM signals (say, to use with an AM only vintage car radio). But I haven't seen anything about the inverse: converting an AM signal to an FM signal (because there are quite a few FM-only devices on the market now, such as MP3 players). I found this: http://www.uashem.com/pageid-259.html , but it doesn't really fit my criteria. I'd like to be able to tune in any AM station, and then select the frequency to output it to without interfering with other station (think iPod transmitter).

Surely there's gotta be some out there...

Expensive test gear?

Most useful is a magnifying glass to look for dry joints
I'd estimate that 90% of rigs given to me to repair
are resolved by optical examination followed by solder
re-flowing.

Soldering irons - to the bottom of one of your smaller bits,
attach a chocolate box connector (& remove the plastic
covering before it melts and fills the shack with toxic fumes!)

To the other half of the chocolate box connector, attach a
range of obscure "bits" of metal that you've fashioned to deal
with the various SMD shapes. Most Useful is an old Henley
"Solon" bit that has a slot filed in it to sit either side of an
SMD R or C.

"SMD rework station"??? Fashion from bits left over from
your Mecaano set - create an overarm with a spring loaded
plunger to bear down onto the component to prevent

tombstoning. Working end of plunger to be wooden, cocktail
stick or chopstick serves nicely. Sacrificial 'cos slowly
burns away. Only once had a problem with resins oozing
out from wood.

Come on, chaps, this is simple mechanical bodging, a trivial
matter for any self-respecting _REAL_ Radio Ham!
(Unless you fail to secure your PCB before rework,
it ain't "Rock It" Science :-))

"Only used for the one repair"??? Is that a CBer talking? Surely
the essence of _REAL_ Ham Radio is that you're using this
type of equipment all the time? (Not true for a CBer-masquerading-
as-a-Radio-Ham, though!)

"today's microprocessor, DSP and firmware laiden transceivers"? All
REAL Radio Hams thrive on how thing work and how to modify
them!

Indeed, if you're a _REAL_ Radio Ham, then your transceiver will
have been designed, constructed and modified by you, so the
" microprocessor, DSP and firmware" will be your design anyway and
therefore not a problem.

"laiden"????? ITYM "laden". I'd advise you not to seek a job in education
because of that!

Presumably you are thinking about a transmitter like this?
http://www.techfocus.co.uk/iTrip-FM-Transmitters/TFM07.htm
I bought one last week, and it seems to work OK.

I don't think that you can really convert AM to FM in a controlled way,
without going to baseband audio first. I reckon that the regen circuit
you found relies more on 'act of God' or 'green fingers (thumbs)' than
science.

Ian.

There's that vacuous sneering about "Big K" again,
slipped in on the penultimate line!

You really are a stupid boy, Brian, and your ongoing public
display of playground behaviour continues to render you
unsuitable to be employed in a school IN ANY CAPACITY.

I have no doubt that your KS3 pupils whom you invoke
time and time again show a greater degree of maturity than
do you.

Grow up, OM.

Au contraire! HOMEBREW is possibly the last
bastion of _REAL_ Ham Radio to be found
anywhere on Usenet, and therefore the place
to which intending like-minders will turn.

Therefore, rec.radio.amateur.homebrew is the
IDEAL newsgroup to which the FAQ should not
only be posted, but regularly so!

Putting this into its correct perspective, this came about as the result of a malicious and perjurous complaint made by Brian Reay, G8OSN, M3OSN, and it is at Brian Reay's door (and now also the RSCB's door) that any complaints of Bad PR must be laid.

Brian Reay subjected me and my close family members to a campaign of harassment wherein he published repeated racially-aggravated pornographic emails to these NG. He maintained this campaign over a period exceeding two years. How his sick-minded obsession was ever relevant to Ham Radio and to these NG, or how it was ever in response to anything that I had posted, has never been established.

Having put up with this for an extended peiod, I then discovered that not only was Brian Reay a schoolteacher, but he was publishing his sick racially-aggravated pornographic emails whilst under training at a Girls' School.

I did no more than to assert the right of reply in defence when I asserted that no-one with such a sick-minded history of international publishing should be a school teacher UNDER ANY CIRCUMSTANCES.

I hold to that view today.

Brian Reay's infantile response to having the tables turned on him was to make a malicious and perjurous complaint to his fellow w*nkmasons to allege that I was harassing him rather than the oher way around which is obvious from the Google archive to this day.

Indeed, in the months leading up to his orchestration of my arrest, Brian Reay chortled on several occasions that he was deliberately provoking me.

While I agree with some of what you say about slipping standards, nevertheless numbers are shrinking and new blood must be encouraged into the hobby/pastime/service/pursuit, etc, else we will be gradually whittled away like the dodo until the bands are so empty that governments will gleefully sell off our slices of the RF spectrum.

Admittedly, some of this new blood might not be of the 'quality' of some of the old, but among the new intake there are individuals with plenty of enthusiasm, curiosity, inventiveness and manners to make up for the minority that might dismay some of the old guard.

I've a feeling that some / most of the coarser new licencees will not have the staying power and we will not hear of them after a couple of years.

I disagree totally.

There is not now, nor there has there ever been, a need,
desperate or otherwise, to get "new blood".

There are more licensees today than there were in the late 70's
just prior to the influx of CB hobbyist operators.

If the "new blood" propaganda is allowed to develop, we will
end up with a Mongolian Horde of non-techical turnip-brains,
the perception of which by govt agencies will result in a faster
regulation of the technical freedoms we enjoy.

It is far, far better to proceed with technical seed-corn and to
retain our technical privileges, even with reduced numbers.

o
> the hobby/pastime/service/pursuit, etc,

Why do people continue to propagate this myth? The Amateur Service is=20
not dying, and never has been, and the numbers are not falling. Even=20
the IARU quite clearly state this in their document "SPECTRUM=20

REQUIREMENTS OF THE AMATEUR AND
AMATEUR-SATELLITE SERVICES Revised August 2006" at=20
http://www.iaru.org/ac-spec06.html

When referring to the 7MHz allocation, the IARU say "The amateur service =

requirement continues to be for at least a 300-kHz allocation. This=20
requirement is even greater today than in the past, owing to the=20
increasing number of amateur stations and the expanding diversity of=20
modes of emission used in the amateur service". Note the phrase=20
"increasing number of amateur stations"!

When referring to the 14MHz allocation, the IARU say "The growth of the=20
amateur service and its heavy dependence on this band for international=20
communication....". Note the phrase "the growth of the amateur service".=

This doesn't sound like anything that is dying.

The only people who try to propagate the myth that the Amateur Service=20
is dying are those who have a financial interest (national societies=20
through membership numbers and equipment manufacturers/retailers).=20
Don't listen to them. Instead, turn on your radio and listen to that=20
instead.... you will find it is busier than ever!

The latest data available on the IARU website at=20
http://www.iaru.org/statsum00.html (bottom of the page) shows the number =

of licensed amateurs from 1965-2000. In 2000 the number was at the=20
highest ever, so where is the evidence to back up the 'dying' theory?=20
However, the number of licensed amateurs who were also members of their=20
national society was at the LOWEST number ever (19.6% in 2000 compared=20
to 38.6% in 1965).

There are too many people with no real interest in amateur radio who are =

continually pushing to have the standards lowered so that they can gain=20
financially from it. They do this by lying through their teeth that=20
amateur radio is dying and use scare tactics that we will lose=20
allocations. It is time to put a stop to this!

--=20
ARRL membership =3D $39 (~=A320)
RSGB membership =3D =A344

Don't let them rip you off any more.
Do the right thing, resign from the RSGB today.

The RSGB said Radio Amateurs were a threat to national security!
Is this the type of organisation you want to represent you?

The first pre-production pcb has been built and put into service. Pictures of this board are now available at
http://www.telstar-electronics.com/default_files/NewProductDevelopment.htm
Several other additional boards will be built and put in service within the next two weeks. After this pre-production pilot... final adjustments will be made to the pcb to allow for easier/better manufacturing before the final pcb is released.

P.S. I may be looking for several radio techs in the next few months that would agree to do some beta testing. Email me with your qualifications to be considered. The beta units will be free of charge... and I would only expect a detailed performance report in return.

The amount of AM being used on 80m is also a very encouraging sign;
seemingly contacts can be had at almost any time, and on any
phone-section frequency. Special nets need not be used to get
contacts, if the onservations of my tuning around are typical.

Where do these occur? I'd like to listen in- or maybe even join in.

I do join an AM net on 160m from time to time (school holidays, it may get noticed if I set up a shack in the back of the class room- although I know of one teacher who did just that!).

> Surely there's gotta be some out there...

If you need a small "converter" (of audio), all you need is a frequency-modulated oscillator, the oscillator tuned to the FM BC band of your choice. It can be a single transistor with something like a simple variable capacitance diode (or equivalent) doing the FM.

The circuit shown in your reference has no magic conversion and is little more than a jammer of everyone in its tuning

range. If it works at all then it would be by overloading the
input of an FM BC band receiver and forcing it to be a mixer.
That is NOT good homebrewing since the same single-transistor circuit could be converted to an FMed oscillator
with its output attenuated (to avoid undue radiation) and
loosely coupled to the FM receiver. If you have audio, even
if only from the speaker of an AM receiver, then you have
the modulation source...at audio, something you can hear
to make sure there IS a modulation signal input.

Try 3615 kc/s (UK) and 3705 kc/s (Dutch); both are monitored even when no activity is apparent. Also look at 3610 - 3640 kc/s.

Other UK nets can be heard in the 3660 - 3690 kc/s section; but AM can pop up anywhere in the phone section, as people do not necessarily limit themselves to the regular nets.

The sound of AM rigs is much different to those of SSB equipment even when the latter operate a form of AM, and military and homebrew gear have a cachet that modern radios just can't recreate.

Although before your time, it's rather like the situation with 2m after the war - Monday night was Activity Night, to encourage activity and increase band usage. That became a success, necessitating abandonment of the regional sections of the band in favour of a national system.

I'm sure ex-SOE and certain other people could advise you on stealth rigs and stealth aerials.....unless they are stealth operators.....;-)

Will do, in fact, the 756 will be on 3615 the rest of the evening.

Oh I know, we've a few "AM addicts" around here- and more power to their
elbow (or perhaps PA).

 >>I do join an AM net on 160m from time to time (school holidays, it may
get
>>noticed if I set up a shack in the back of the class room- although I

There is a thought. We've not got permanent antennas at school yet (although
permission has been obtained and a local has donated materials and effort
for erection there of). At the moment, I use a simple indoor beast for 2m
practice QSOs and an HF inverted V I "throw up" on an ex-MOD mast I have.

The permanent set up isn't in my classroom- the Technology department have
provided the shack space and the roof space for the antennas. The maths
building is a new(ish) specialist block that isn't was tall as the Tech
block- although it probably is better placed for HF antennas.

The pupils respond well to the hobby- I stir some "real world" problems to

```
maths lessons (eg formulae transposition at the lower end  and some of the
higher maths at A level). I've plans for some "code breaking" lessons for
extra maths later this year, they will cover the maths in error correcting
codes etc.

A friend of mine wanted to get a ham ticket for years, but the thought
of having to learn the code stopped him.  When the codeless technician
license came out he jumped on it.  Once on the air, guess what happened?
Maybe it was the repeaters id'ing in morse, but he finally decided to
learn the code and got his tech plus!  Wonder if there is a moral lesson
here?

Any modification would probably require more skill than assembying a part15 tx kit.

A typical 70's/80's AM transistor radio will have several parts that will be usable (e.g. oscillator coil, tuning cap, lots of small resistors and transistors, an audio amp maybe with output transformer that could be used for modulation) either as raw parts or as subassemblies. But you aren't going to do it without soldering, and probably judicious use of exacto knives too!

Tim.

Why do you sell a rf amplifier that covers "26-30MHz Coverage"
It sounds like you are selling a CB amp which I thought was illegal.
Just curious, Thanks

Big old dish from an obsolete tv microwave system aimed at the city with
another one aimed down the hill. Depending on path loses, you may just
be able to use two horns from one dish to the other. The first thing to
be done is to find what you have to work with at the top of the hill.
You need to find the existing signal levels.. IF there is a high
mountain toward the side of the signal path you might be able to bounce
it off that mountain if it is mostly rock.

have fun.

Cheat. Use a very short extension cord between the UPS and the wall
wart.

Well now, I'm onto bigger and better things.

I was doing a bit of reading lately and came across some interesting topic one being VCO. The VCO I saw used a Optical Shaft Encoder (OSE). The setup used was rather odd looking to me and didn't look that mechanically stable.

Could someone explain VCO to me? And, also what type of VCO would be the best in a transceiver considering the technology of the past 10 years? Are there digital VCO's?

Greg

A necessary preface.....

(It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery.
However, there still exists the fundamental basis on
which Ham Radio is based, and that will never die.

This FAQ ("What Is Ham Radio?") will
be regularly published and will not be shouted or bullied
down. It is important that those of a technical bent, who
are the natural seed-corn of Radio Hammery and who
gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.)

-----ooooo-----

So,.....What is Ham Radio?

Ham Radio is a technical pursuit for those who are interested in the science of radio wave propagation and who are also interested in the way that their radios function. It has a long-standing tradition of providing a source of engineers who are born naturals.

Ham Radio awakens in its aficionados a whole-life fascination with all things technical and gives an all-abiding curiosity to improve one's scientific knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience with ones fellow man, and shows itself in the gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that they can construct and operate their own equipment! No-one else has this privilege. Users, such as broadcasters, the po lice and armed farces, CBers and mobile phone users have to purchase ready-made gear. Manufacturers are not licensed to operate their gear. Radio Hams are qualified to design, build and then operate their own pieces of equipment. They do this with gusto, and also repair and modify their own equipment. This is a privilege well worth the effort to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with relatively simple technologies at first, perhaps making his own Wimshurst machine and primary cells. Small pieces of test equipment follow, possibly multimeters and signal generators. Then comes receivers and transmitters. It is with the latter that communication with like-minded technically motivated people takes off. The scope for technical development grows with the years and now encompasses DSP and DDS. There is also a great deal of excitement in the areas of computer programming to be learnt and applied.

The technical excitement motivates Radio Hams to compete with each other to determine who has designed and manufactured the best-quality station. This competitiveness is found in DXing, competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a desirable thing to have that there are large numbers of people who wish to be thought of as Radio Hams when, in fact, they are nothing of the kind! Usually such people are a variation of the CB Radio hobbyist; they buy their radios off the shelf and send them back to be repaired; they are not interested in technical discussion and sneer at those who are; they have no idea how their radios work inside and have no wish to find out; they are free with rather silly personal insults.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist from the _REAL_ Radio Ham is to solicit their view of the difference between CB Radio and Ham Radio. A Radio Ham will perceive Ham Radio to be a technical pursuit and will perceive CB Radio to be a social communications facility no different in essence to a land-line telephone or a GSM mobile in the hands of a 6-year-old. Thus a Radio Ham could also hold a CB licence safe in the knowledge that such a licence says no more about him than having a land-line telephone, whilst continuing to regard Ham Radio as a separate technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between a Ham Radio licence and a CB Radio licence. To him, they are sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then tries to classify himself as the equal of the Radio Ham when, in fact, he is nothing of the kind.

Ham Radio is not CB Radio and has no common ground with it! Ham Radio is _THE_ technical pursuit for gentlemen; CB Radio is the name for the operating hobby for those who buy their rigs and equipment off the shelf.

-----ooooo-----

If you are the sort of person who is motivated by a technical interest in how things work; if you took apart malfunctioning clocks, toasters and the like and put them right despite never having seen them working, then a Ham Radio licence is your traditional route! There has never been a shortage of such people, and those who gravitate towards such an interest have always been welcomed into our shacks and their interests fostered. There is not today, nor has there ever been, a need to go out and encourage and press children, children who have never expressed an interest in Ham Radio, to come into our shacks. Such an activity should cause eyebrows to be raised - what normal well-adjusted adults seek the social acquaintance of children?!

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_
to you to exert yourselves to join our fraternity!

Hello Anthony,

The large capacitance of C1 (10nF) has caused an interrupted oscillation.
Please change its value to 1000p and the oscillator will work as expected.
I have also added MEASURE-commands to measure the frequency.
View -> SPICE Error Log

Another method is using the FFT in the waveform viewer.

Best regards,
Helmut

Save as "osc1.asc".

Okay, that certainly explains why all the sample circuits I find don't expend any great effort at creaing a nice sine wave, and none at explaining why. What you say certainly makes sense, especially if there are no really negative consequences of having the oscillator make a "less than perfectly shaped" wave.

> Frequency stability and phase noise performance are often achieved by

Ok, thanks for the information. :-) I did allot of googling but found nothing that explained it like this. I was thinking of building a little single conversion superhet WWV receiver for 10MHz, if I continue with that I'll just concentrate on cleaning it up in another stage.

Some material I read suggested keeping Xl of L1 at ~300Ohms, the series Xc (C3) at ~200Ohms and Xc of C1/C2 at 45Ohms. Do you have any thoughts on that? Right now I have way too much inductance for 3.5MHz by that theory, and judging from other circuits I've seen. <10uH seems to be the going thing for around 4MHz?

I have never seen clipping. These things are supposed to limit in cutoff,
not saturation. As the signal build up, the conduction angle gets smaller
and smaller until the device runs out of gain. That is another way of saying
that the DC value of the gate voltage gets more negative the bigger the
amplitude. This works out automatically with a JFET.  You need about 10K -
100K DC resistance from gate to ground. Using a bipolar transistor is not a
good idea.

That sounds more or less right. With a Clapp oscillator the main tank
is isolated by the series cap, so more of the energy is kept in the coil
and C3, and less of it shows up in C1, C2, and the transistor.

If you're driving a balanced mixer you want to have an LO signal that
doesn't have much even-harmonic (2nd, 4th, etc.) energy in it, but for a
casual receiver that's the least of your worries. Since you're
operating at a fixed frequency it may be a good idea to just feed the
oscillator output into a single-tuned resonant circuit to clean it up,
then send it on to the mixer.

I was wondering about the load that a bipolar would present. I will see if
I can find a JFET in my junk pile, thank you. :-)

In some LC oscillators, the amplitude of the oscillation is controlled by a feedback loop. For example, a rectifier can be used to create a DC voltage proportional to the oscillation amplitude on the LC tank, and then an op-amp can be used to compare the rectifier output signal to a reference voltage. The output from the op-amp can be filtered and then used to control the current in the oscillator core. It is difficult to do all of this in a way that keeps the phase noise low, but given the right simulation tools (e.g. SpectreRF which is rather expensive), good results can be obtained. In particular, a well-defined oscillation amplitude can help to keep the KVCO well controlled, which is useful in PLLs.

Chris

Thank you very much.  :-)  I have now switched to using an MPF102 JFET
instead of the bipolar and much less capacitance for C1 (now 470pF).  I only
get a 2V peak to peak signal out now, but it's quite nice looking.

Ok, I've now put in an MPF102 and changed R3 to a pull-down. I lowered C1
to 470pF and I get a nifty 2V p-p sine wave on the output. It really tamed
the tank circuit voltage down as well. Which brings up a question, with the
tank now completely DC blocked from Vcc and Vss, where does it get it's
energy. I assume that it must come thru the gate. How does that happen?
:-? My circuit is much like Figure 1 here, without the diode though:
http://www.electronics-tutorials.com/oscillators/clapp-oscillators.htm

It comes from the source, through the coupling capacitors -- Cfb-a and
Cfb-b in your link.

Without going to the purity levels that Tom requires, I've always found that bipolars can be used to produce a fairly reasonable "visibly sinusoidal" (see note) waveform. Follow the oscillator with an amplifier stage which drives a limiter/clipper, and use that to control a gain element in the oscillator. It's like the incandescent non-linearity arrangement except the oscillator stage waveform remains fairly clean.

(Note: Harmonic distortion not readily discernible on a CRO)

That is another way of saying that the DC value of the gate voltage gets more negative the bigger the amplitude. This works out automatically with a JFET. You need about 10K - 100K DC resistance from gate to ground. Using a bipolar transistor is not a good idea.

I have now changed it to an MPF102 that I've had laying around for many years. It works great, thanks.

Glad it worked out. By the way the feedback path is through the capacitive network between source and gate. That would be more obvious in the configuration that uses a tapped inductor, but works the same way. Leaving out the diode was the right thing to do; it just adds to the noise. I don't know what kind of stability and linearity you need, but if that is important, do not use the common type of ceramic capacitors that are meant for bypassing. They are lossy, and their value varies with applied voltage. Use mica, NPO ceramic, or Mylar and similar for larger values.

Tam

I had to play around with this quite a bit to get it running near 10MHz. It
seemed to be more picky about the cap ratios than their actual values.

> the same way. Leaving out the diode was the right thing to do; it
> just adds to the noise. I don't know what kind of stability and

I figured that it would cause horrid clipping the way it was installed. I
thought maybe the designer intended it to be the other way around to protect
the transistor from reverse voltages on the gate, hmm.... always something
to keep you guessing. ;-)

I don't really "need" anything in particular, it's just an exercise to try
and learn something. I just used the ceramic caps because they were handy.
I didn't have a pile of NPO caps laying around. ;-) I d

Time to add a buffer now since the scope probes load it down so badly now.
I'm getting 1.1Vpp into the apparent 5M load of two scope probes. It's
probably pulled a ton off frequency as well. Let's see.....(removes one

probe).....yep, 90KHz rise in frequency after taking one probe off.

I've eventually found some good plots of the frequency responses of crystals (see below).

http://g4oep.atspace.com/crystal_filters/signal_frequency_crystal_filters.htm#4)%20Single-Crystal%20Ladder.

This info from G4OEP is about filters, rather than VXOs, but it graphically illustrates how a crystal can be neutralised in a bridge circuit, using a small capacitor rather than large inductor. The capacitor will be the same value as the parallel capacity of the crystal.

The plots in Figs 9, 10 and 12 also show how the throughput peak moves around to some extent as the neutralization is adjusted. The circuit is essentially the same as I used when I was testing a load of crystals to see if they met spec wrt frequency accuracy and ESR.

You should be able to use the circuit of the single crystal filter (in-to-out, without the resistive padding etc) as the resonant part in a VXO, and adjust the neutralization to pull the frequency of oscillation. It's worth a try.

Ian.

Oscillators have to have gain greater than one at the frequency of oscillation.

When turned on, the amplitude builds up until something in the circuit cuts back the gain. In simple oscillators, that "something that cuts back the gain" is almost always the active device saturating and distorting its output.

The higher your gain, the more reliable the oscillator starting up, but also the higher the distortion.

If you take the output not from the output of the active device, but from a lightly-coupled tank, then you'll see something much more like the sine wave you were expecting. This is what you see at the L1/C3 junction. But still you'll get lower distortion there if the active device isn't driven so far into saturation/distortion. And by definition you cannot suck much power out of the L1/C3 junction without decreasing the Q of the tank and making distortion there too.

You can add a few more active devices and not only buffer things but also put a fairly linear AGC in the loop. This still has distortion, but this is done intentionally in a rectifier to derive the AGC control voltage, which is then filtered. The intentional distortion does not have to appear in the output!

Clever use of devices can make the AGC loop quite beautiful. Look at the Wien Bridge or Meacham Bridge oscillators that use a light bulb in the bridge to not only be the loop-control device but also do filtering (thermal time constant of the filament).

Tim.

The prettiest waveforms come from balanced oscillators. Distortion then turns up as 3rd 5th 7th etc harmonics which are far less ugly than the 2nd 3rd 4th 5th etc generated by the single ended types. Balanced ALC is also easier and more effective.
My own experience says that 'prettier' is better. Those oscillators offering gross distorted outputs also seem to suffer badly in other areas and gross

distortion always causes problems further down the line.
Procuring good quality is a classic black art, one aspect is to allow the
LC just an occasional vague glimpse of the maintaining amplifier. Another is
to cause limiting by use of an amp having a gentle gain change (eg Fet v
bipolar) and the other is ALC. (Or all three together).
Failing that, there is always the cop-out of an output filter :)
john

The "conversation" that L1 and C3 sure looks nice on the scope. :-)

Well there sure isn't much talk about it out there.  Material I find is
like, "here's a schematic, pick a coil and cap and your done.  No one seems
to care what the result looks like.  Seems like you can make a reasonably
decent wave _and_ still have the oscillator start reliably.

> Failing that, there is always the cop-out of an output filter :)

Seems to be the way people like to do it.  ;-)

It seams reasonable that if I can look at the junction with a scope and the
wave looks good, I should be able to tap it with a secondary JFET without
destroying it. Yet I see no examples of that being done. I guess it's just
easier to accomplish the waveform repair by using a tank on the output of
the oscillator and not loading down the primary tank circuit.

This sounds like what Chris Jones was talking about. Do you have a link so
I could check it out?

Symmetry is a nice word to use where LC resonance is concerned.
Symmetry for the drive and clipping mechanisms.

Have a look at a long-tail transistor pair with cross-coupled
collector-base feedback resistors, and collectors driving a
centre-tapped LC resonant circuit.

A "classic" oscillator with AGC is the Sulzer Oscillator. Very nice
pics and schematics at

  http://leapsecond.com/museum/sul25-1/

> > Clever use of devices can make the AGC loop quite beautiful. Look at

For really nitty-gritty stuff about low-distortion oscillators, see
Jim Williams' examples in Linear Technologies appnote AN-43. (Go to
http://www.linear.com/ and do a search for "AN43" without the hyphen).
Most of the examples there are bridges, and distortions in the
sub-0.1% category are achieved AND THEN IMPROVED UPON BY FACTORS OF
HUNDREDS! Also google "Meacham Bridge" and "Wien Bridge".

Tim.

In addition to the low-noise-low-distortion-high-stability URL's I pointed you towards in my other followup, recent ARRL Handbooks have some really clever low-noise VFO circuits using a multitude of approaches, including explicit AGC circuitry. I have been slowly working my way through the cookbook examples and every example has its merits.

In typical ham use, for better or worse, stability and reliability to start-up are often the most important criteria. What you are complaining about when you see a distorted output, is something that is actually a design goal of oscillators that are followed by multipliers.

One very common method over the years of decoupling the frequency-determining tuned circuits from other frequencies generated in a radio is to run the oscillator grid tank at half the output frequency and depend on distorition to make the desired output frequency. In the simplest case a balanced or push-pull oscillator is a "No-No" because you WANT the second harmonic. The electron-coupled oscillator that was in the 50's/60's/early 70's handbooks is a classic design.

Tim.

Some people worry a whole lot about it. What they worry about,
typically, is phase noise first and stability second. Lack of
harmonics in the waveform are generally lower on the list. That's
because filtering out harmonics is relatively easy, compared with
cleaning up phase noise and stability problems. You can find lots of
articles on minimizing phase noise, but there's also quite a bit of
trade-secret sorts of knowledge whose owners aren't particularly
interested in sharing, understandably. It's far from trivial to get
the phase noise and spurious performance you'll find in the good
commercial signal generators. Good as they are, though, I know of
none that's good enough to be used without harmonic filtering to do
low-level harmonic distortion measurements.

Cheers,
Tom

One thought we've had is to build a SA602/SA605-based fundamental mode
Colpitts oscillator (with two capacitors and the crystal) and then tap
into the mixer output, leaving the RF intput disconnected. If the
mixer does not mix with anything, we will get an amplified/buffered

13.56MHz signal. Would this not work?

Also, I am not clear how to chose the capacitor values for the Colpitts oscillator - there is no guidance in the application notes. I think these values are not critical? Our crystal frequency is 13.105MHz.

Ben

A resistor will do as good, a high value of resistance relative to he impedance of the receiver. I use 100K. The neon bulb can be fun though. I used to have one attached to a long wire(200 Ft) or so and it was fun watching it flash during storms.

The images primarily showed how the stopband notch moved around.
So I decided to put it into spice.

Compared to L compensation it does seem to have a benefit as higher
frequency peak. It also is not troubled by the side-effect of
L-compensation as passing lower and higher frequencies than those
around the crystal frequency.

Trying to make the most of the balancing compensation I placed a small
capacitor in series with the crystal. This moves the pass band
frequency up a bit more. But the smaller the series cap, the less
pronounced the peak seems to be. Also the circuits starts to attenuate
more and more. This might cause difficulty in an oscillator setup
where the loop gain should stay more than one.

Also with the balanced compensation circuit, the phase is changed
around the peak frequency. Without series cap around -45 degrees,
climbing to -83 with 12pF. This should be accounted for in the
feedback loop of an oscillator. (A properly dimensioned L-compensated
crystal does not change phase.)

But all in all it might be a (complex) method of shifting the working
frequency up.

Joop

I have more portable radios than I know what to do with and was wondering if I could somehow convert one of them for use as an extremely low-powered AM transmitter for use around my apartment. I need only a range of 10 feet or so and I really don't want to buy any sort of kit as Part-15 regulations in the US prohibit their use but do allow homebuilt units. I had one of those toys called a Wild Planet Radio DJ that was FCC type-approved but it got misplaced in my last move and now my old-time radio shows are just sitting there waiting to return to life on my antique radios.

Or, should doing that prove impractical, how hard is it to learn how to solder? :-)

Oh Wow! You opened up a whole can of worms with this post.

1) What part of Part-15 does not allow kits? I think it only requires low power levels (depends on frequency) and compliance with antenna size restriction (also depends on frequency). You can purchase Part-15 compliant transmitters, Part-15 compliant (supposedly) kits, or could build your own Part-15 compliant transmitter. There is, as far as I know, no formal "Type Approval" process for Part-15 transmitters. If you purchase a pre-built Part-15 compliant transmitter, be sure it contains a label by the manufacturer stating that it complies with Part-15 regulations. If you build a kit, or build something up from a magazine article or your own design, you will be responsible for insuring that it is Part-15 compliant.

2) It would be possible to modulate the internal local oscillator on one receiver and use it as a transmitter to other radios, but that is somewhat complex and does require soldering, component removal, component addition, etc. Again, you would be responsible for insuring that the resulting transmitter device was Part-15 compliant.

3) For local in-house use you only need a few milliwatts of RF power. There are kits available for that, or you could build up your

own crystal oscillator and modulator circuit. Just be sure to keep the power and antenna size within FCC Part-15 requirements for the frequency you are using.

4) Ham Radio is not the answer for what you want to do, because ham regulations in the US do not allow "broacasting" (i.e one-way-only transmission) and also do not allow music transmission.

I did that as a kid with tube type radio. I moved the connections to the antenna coil to replace the first IF coil. I connected the audio to the grid in place of the antenna coil. You have to re tune the oscillator and antenna coils to be on the same frequency.

On tube type radios this was easy but on newer radios with a circuit board, I don't know.

That reminds me of the Halicrafters S22-R I had upstairs in my bedroom when a boy.
By clipping a wire on to the IF (1.6 MHz), I was able to listen downstairs on a MW receiver.

Once I was staying at a holiday camp and was being kept awake by a loud

radio in the adjoining chalet.
I touched the TV aerial lead on the local oscillator of my Murphy portable
and wiped out their signal.
After a while they gave up and switched it off.

I was so pleased with myself I couldn't get off to sleep !

Taking a valve receiver as an example, I suppose the loudspeaker could be
used as a microphone
and the local oscillator amplitude modulated.
Some soldering might be required !

Russ

Will not be muuuuch easy for homebrewing a simple FM transmitter
instead ?

A necessary preface.....

(It is becoming increasingly difficult to fly the flag for decency and for civilised behaviour in Radio Hammery. However, there still exists the fundamental basis on which Ham Radio is based, and that will never die.

This FAQ ("What Is _REAL_ Ham Radio?") will be regularly published and will not be shouted or bullied down. It is important that those of a technical bent, who are the natural seed-corn of Radio Hammery and who gravitate towards us to be the real novitiate, can still find us, (and know that we are still here), their fellows.)

-----ooooo-----

So,.....What is _REAL_ Ham Radio?

REAL Ham Radio is a technical pursuit for those who are interested in the science of radio wave propagation and who are also interested in the way that their radios function. It has a long-standing tradition of providing a source of engineers who are born naturals.

Ham Radio awakens in its aficionados a whole-life fascination with all things technical and gives an all-abiding curiosity to improve one's scientific knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience with ones fellow man, and shows itself in the gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that they can construct and operate their own equipment! No-one else has this privilege. Users, such as broadcasters, the po lice and armed farces, CBers and mobile phone users have to purchase ready-made gear. Manufacturers are not licensed to operate their gear. Radio Hams are qualified to design, build and then operate their own pieces of equipment. They do this with gusto, and also repair and modify their own equipment. This is a privilege well worth the effort to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with relatively simple technologies at first, perhaps making his own Wimshurst machine and primary cells. Small pieces of test equipment follow, possibly multimeters and signal generators. Then comes receivers and transmitters. It is with the latter that communication with like-minded technically motivated people takes off. The scope for technical development grows with the years and now encompasses DSP and DDS. There is also a great deal of excitement in the areas of computer programming to be learnt and applied.

The technical excitement motivates Radio Hams to compete with each other to determine who has designed and manufactured the best-quality station. This competitiveness is found in DXing, competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a desirable thing to have that there are large numbers of people who wish to be thought of as Radio Hams when, in fact, they are nothing of the kind! Usually such people are a variation of the CB Radio hobbyist; they buy their radios off the shelf and send them back to be repaired; they are not interested in technical discussion and sneer at those who are; they have no idea how their radios work inside and have no wish to find out; they are free with rather silly personal insults.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist from the _REAL_ Radio Ham is to solicit their view of the difference between CB Radio and Ham Radio. A Radio Ham will perceive Ham Radio to be a technical pursuit and will perceive CB Radio to be a social communications facility no different in essence to a land-line telephone or a GSM mobile in the hands of a 6-year-old. Thus a Radio Ham could also hold a CB licence safe in the knowledge that such a licence says no more about him than having a land-line telephone, whilst continuing to regard Ham Radio as a separate technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between a Ham Radio licence and a CB Radio licence. To him, they are sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then tries to classify himself as the equal of the Radio Ham when, in fact, he is nothing of the kind.

Ham Radio is not CB Radio and has no common ground with it! Ham Radio is _THE_ technical pursuit for gentlemen; CB Radio is the name for the operating hobby for those who buy their rigs and equipment off the shelf.

-----ooooo-----

If you are the sort of person who is motivated by a technical interest in how things work; if you took apart malfunctioning clocks, toasters and the like and put them right despite never having seen them working, then a Ham Radio licence is your traditional route! There has never been a shortage of such people, and those who gravitate towards such an interest have always been welcomed into our shacks and their interests fostered. There is not today, nor has there ever been, a need to go out and encourage and press children, children who have never expressed an interest in Ham Radio, to come into our shacks. Such an activity should cause eyebrows to be raised - what normal well-adjusted adults seek the social acquaintance of children?!

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_ to you to exert yourselves to join our fraternity!

As a kid I fooled around with radio circuits. I built a solder less
breadboard for building and tearing down circuits that had 4 octal
sockets and tons of farinstock clips for interconnecting parts. I had
quit a few old tubes in the junk box when an old time radio repair man
gave me what was left of the contents of his tube caddies.

So I wound an oscillator coil around a cardboard tube from toilet paper
and built a Hartly oscillator with a 6F6G running with 300 volts on the
plate. It was modulated by another 6F6G choke coupled to the
oscillator. So I was running near 1-2 WATTS input. I connected several
feet of wire as an antenna to the cathode of the oscillator tube and
tuned it to the middle of the broadcast band at an empty spot on the
dial. A crystal phono pickup directly drove the modulator tube.

I would put on an LP record and take a transistor radio outside to see
how for out it got. It covered the whole block! Probably illegal
power, but I never used it long enough for anybody to notice. Without
the antenna, I could still hear it anywhere in the apartment house.
